State of Utah
Gary R. Herbert
Governor

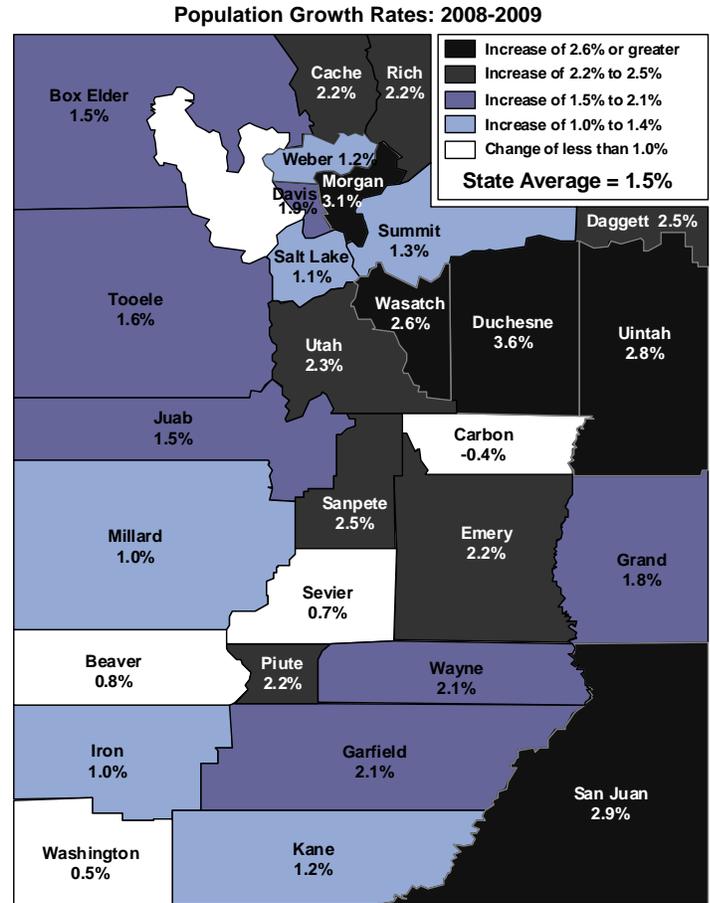

Demographics

- Population**—The State of Utah's July 1, 2009 population was an estimated 2,800,089, an increase of 1.5% over 2008, according to the Utah Population Estimates Committee (UPEC). This is lower than the record growth of 3.2% experienced in 2007. A total of 42,310 people were added to Utah's population, with 3.7% of this increase coming from people moving into the state. Utah's unique characteristics of a high fertility rate and low mortality rate consistently contribute to strong natural increase, the difference between births and deaths. In 2009, the number of births did not surpass the record of 55,357 set in 2008. However the 54,548 births led to a strong natural increase of 40,763. Deaths within the state totaled 13,785 in 2009. Net in-migration totaled 1,547—less than 10% of last year's number.
- Rate of Growth**—According to the U.S. Census Bureau, Utah ranked second among states, behind Wyoming, with a population growth rate of 2.1% from 2008 to 2009. The U.S. rate of growth was 0.9%.
- Median Age**—Utah was the youngest state in the nation with a 2008 median age of 28.7, compared to the national median of 36.8.
- Long-Term Projections**—The State's population is projected grow to 3.7 million in 2020, 4.4 million in 2030, 5.2 million in 2040, 6.0 million in 2050, and reach 6.8 million in 2060. The growth rate, which will exceed that of the nation, will be sustained by a rapid rate of natural increase.

2009 Utah Population Estimate	2,800,089
2008-2009 Percent Change	1.5%
2008-2009 Absolute Change	42,310
2009 Net Migration	1,547
2009 Fiscal Year Births	54,548
2009 Fiscal Year Deaths	13,785
2009 Natural Increase	40,763

Employment and Wages

- Employment**—Employment declined 4.9% in 2009 and is expected to decline 1.8% in 2010.
- Industry Focus**—Education and health services and government were the only industries to have job growth during 2009. Construction experienced the largest decline of 22.6%.
- Unemployment**—Utah's 2009 unemployment rate was 6.5%, up from 3.4% in 2008. In 2009, there were an average of 89,100 unemployed Utahns.
- Average Wage**—In 2009, Utah's average annual nonfarm wage was \$37,764, an increase of 0.8% from 2008.

Percent Change in Utah Employment by Industry: 2008-2009 Annual Averages

Total Nonfarm Employment (2009e)	1,191,600
Change (2008-2009)	-60,973
Percent Change (2008-2009)	-4.9%
Unemployment (2009)	6.5%
Total Nonfarm Wages (2009e)	\$45.0 billion
Percent Change (2008-2009)	-4.1%
Average Annual Wage (2009e)	\$37,764
Percent Change (2008-2009)	0.8%
Total Personal Income (2009e)	\$86.3 billion
Percent Change (2008-2009)	-1.3%
Per Capita Personal Income (2009e)	\$30,758
Percent Change (2008-2009)	-3.7%

Highlights

- **Construction**—The value of permit authorized construction in Utah in 2009 was \$3.5 billion, the lowest value since 1996. In the past twelve months the value of permit authorized construction has fallen 25%. In inflation-adjusted dollars the value of authorized construction is at the lowest level since 1992. The sharp decline in value in 2009 was led by the severe contraction in nonresidential construction, which fell from \$1.9 billion in 2008 to \$1.2 billion in 2009, a 37% decline. In addition, the weakness of the residential sector continued although the residential decline appears to be slowing. In 2008 the value of residential construction dropped by 53% compared to 15% in 2009. The value of residential construction in 2009 was \$1.6 billion.
- **Tourism**—Utah's travel and tourism sector was not immune to the economic recession, but regional and in-state travel helped to soften the downturn. The Utah ski industry experienced the third best season on record and visitation at national parks increased for the third year in a row. State park visitation was also up.
- **Exports**—Worsening economic conditions in Utah, the nation, and around the globe, were reflected in Utah's production and export levels in 2009. Utah's total exports fell from a record peak of \$10.3 billion in 2008 to an estimated \$9.3 billion in 2009, a decrease of 10.0%. Exports have been above \$4.0 billion since 2002 and above \$6.0 billion since 2005. Record high levels in 2008 were primarily due to robust export growth in the first quarter, dropping sharply as housing and financial market declines translated into weak demand for manufactured goods that migrated to foreign markets.
- **Energy**—In 2009, Utah experienced a significant increase in crude oil and natural gas production despite the downturn in the economy and significantly lower prices. Conversely, coal production decreased as some companies experienced difficult mining conditions, while other mines unexpectedly closed.
- **Minerals**—In 2009, the estimated value of energy and mineral production in Utah was \$6.8 billion, about \$2.6 billion less than the record high of \$9.4 billion in 2008. The lower 2009 value is mostly due to decreased base metal and industrial mineral values and decreased crude oil and natural gas prices. The decline of nonfuel mineral values, which peaked in 2006 (in inflation-adjusted dollars), will likely be offset by the increased valuation of oil and gas in 2010.
- **Agriculture**—It is estimated most agricultural sectors in Utah were less profitable in 2009 than in 2008 and 2007. Factors included lower commodity prices in 2009 than in 2008. Agricultural receipts in 2008 were greater than they had been for the past several years. Due to record high milk prices in 2008, the Utah dairy sector enjoyed record cash receipts and was the largest agricultural sector, as measured by cash receipts.
- **Education**—In 2009, there were an estimated 563,273 students in Utah's public education system, a 2.2% (12,260 students) increase over 2008. Students score favorably compared to their national peers. Utah System of Higher Education enrollment for 2009 was 164,860, an increase of 12,632 (8.3%) from 2008.

Economic Outlook

- **Overview of the Economy**—Like the nation, Utah's economy contracted during 2009. Employment, which increased slightly during 2008, declined 4.9% in 2009. Further, the unemployment rate almost doubled, from 3.4% in 2008 to 6.5% in 2009. The housing collapse combined with business caution about building new plants, resulted in construction employment declining 22.6%, after a decline of 12.5% in 2008.
- **Outlook 2010**—Utah's economy is expected to gradually strengthen during 2010. Employment is forecast to decline 1.8% for the year as a whole, but subdued job increases should begin by the second quarter. Construction employment is forecast to decline 13.6%, a third year of contraction. Housing permits are forecast to remain near historic lows throughout 2010. Strengthening consumer confidence, the end of the housing downturn, increasing credit, and higher stock prices will support the economy during 2010. Though economic activity will be on the uptick, slack hiring will drive a slight increase in the unemployment rate from 6.5% in 2009 to 6.8% in 2010.

2. Rank is most favorable to least favorable.

Preface

The *2010 Economic Report to the Governor* is the 24th annual publication in this series. Through the last two decades, the *Economic Report to the Governor* has served as the preeminent source for data, research, and analysis about the Utah economy. It includes a national and state economic outlook, a summary of state government economic development activities, an analysis of economic activity based on the standard indicators, and a detailed review of industries and issues of particular interest. The primary goal of the report is to improve the reader's understanding of the Utah economy. With improved economic literacy, decision makers in the public and private sector will be able to plan, budget, and make policy decisions with an awareness of how their actions are both influenced by and impact economic activity.

Collaborative Effort/Contributors. Chapter authors, who represent both public and private entities, devote a significant amount of time to this report, ensuring that it contains the latest economic and demographic information. While this report is a collaborative effort which results in a consensus outlook for the next year, each chapter is the work of the contributing organization, with review and comment by the Governor's Office of Planning and Budget. More detailed information about the findings in each chapter can be obtained by contacting the authoring entity.

Statistics Used in This Report. The statistical contents of this report come from a multitude of sources which are listed at the bottom of each table and figure. Statistics are generally for the most recent year or period available. There may be a quarter or more of lag time before economic data become final, therefore 2009 statistics in this report are estimates based on data available as of mid-December 2009. Readers should refer to noted sources later in 2010 for final statistics.

Forecasts are also included in tables and figures. All of the data in this report are subject to error arising from a variety of factors, including sampling variability, reporting errors, incomplete coverage, non-response, imputations, and processing error. If there are questions about the sources, limitations, and appropriate use of the data included in this report, the relevant entity should be contacted.

Statistics for States and Counties. This report focuses on the state, multi-county, and county geographies. Additional data at the metropolitan, city, and other sub-county level may be available. For information about data for a different level of geography than shown in this report, the contributing entity should be contacted.

New This Year. The content of this report is similar to prior years, with the addition of new data and analysis. The Special Topics section of this report contains three chapters: Falcon Hill at Hill Air Force Base, Revenue Forecasting and the Utah State Budget, Housing Updates.

Electronic Access. This report is available on the Governor's Office of Planning and Budget's web site at <http://www.governor.utah.gov/dea>.

Suggestions and Comments. Users of the *Economic Report to the Governor* are encouraged to write or call with suggestions that will improve future editions. Suggestions and comments for improving the coverage and presentation of data and quality of research and analysis should be sent to the Governor's Office of Planning and Budget, PO Box 142210, Salt Lake City, Utah 84114-2210. The telephone number is (801) 538-1027 and the email address is dea@utah.gov.

Executive Summary

Executive Summary

For the second year in a row, the Economic Report to the Governor portrays difficult times. In contrast to 2009, however, the outlook for 2010 foresees a strengthening recovery. Indeed, preliminary estimates suggest employment in Utah began to grow during September 2009. The U.S. is expected to follow suit as early as the first quarter of 2010. Over the long run, Utah's position as a logistical hub for the west, young and productive workforce, sensible regulatory environment, and excellent system of public and higher education will continue to make it a great place to live and work with plenty of opportunity.

National Outlook

While the official determination may not be made for a year or more, the recession that began in December 2007 appears to have ended during the second or third quarter of 2009.

After declining four consecutive quarters, U.S. gross domestic product (GDP) grew 2.2% during the third quarter of 2009. Most indicators of economic activity dropped sharply during the first half of 2009, but stabilized and began to increase during the second half. What initially appeared to be a relatively mild decline, similar to the recessions of 1991 and 2001, changed radically with the failure of the Lehman Brothers investment bank in September 2008. For the rest of that year and throughout 2009, the Federal Reserve and other central banks took unprecedented steps to ease credit conditions, slowing the contraction. Likewise, national governments around the world initiated massive fiscal stimulus programs, led by the \$787 billion American Recovery and Reinvestment Act (ARRA). As 2010 opens, expansionary economic policy supports recovery in both the U.S. and around the globe.

Utah Outlook

Utah was growing normally as the recession began. The year-over percent change in employment was 3%, the historic average, much higher than the 0.8% U.S. growth rate. The state fared well during the initial phase of the contraction because housing prices had not inflated like those in Las Vegas or Phoenix. Moreover, as the U.S. economy expanded following the 2001 recession, the Wasatch Front, Cache Valley, St. George, and Cedar City attracted national attention as good locations for business. The state had a relatively diverse and stable economic base, with less exposure to housing and commercial real estate than the rest of the country at the beginning of the recession. However, as the financial crisis intensified in the fall of 2008, Utah began to track the national downturn. While the economic environment was daunting throughout 2009, the advantages of doing business in Utah that drove growth before the recession still exist and will contribute to Utah's ultimate recovery.

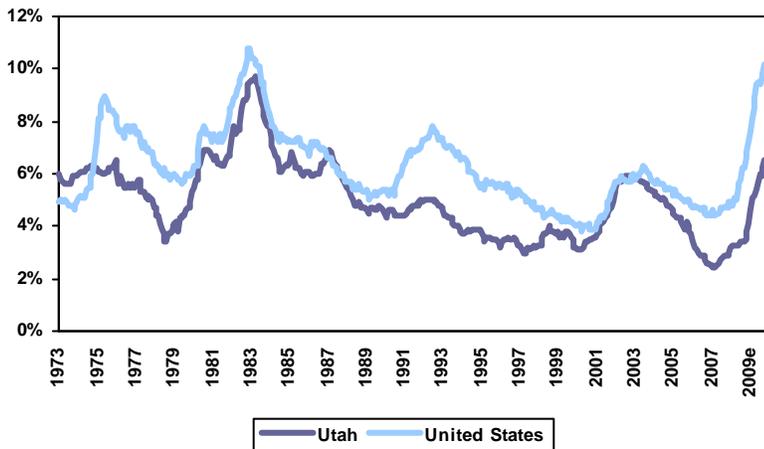

Utah's Long-Term Projections

Though Utah's near-term outlook remains soft, long-term economic and demographic projections point to robust growth over the next half century. Utah's population is expected to more than triple from 2.2 million in 2000 to 6.8 million in 2060. The growth rate, which will exceed that of the nation, will be sustained by a rapid rate of natural increase and a well-diversified economy. As the state grows, new population centers off the Wasatch Front will emerge.

Economic Indicators

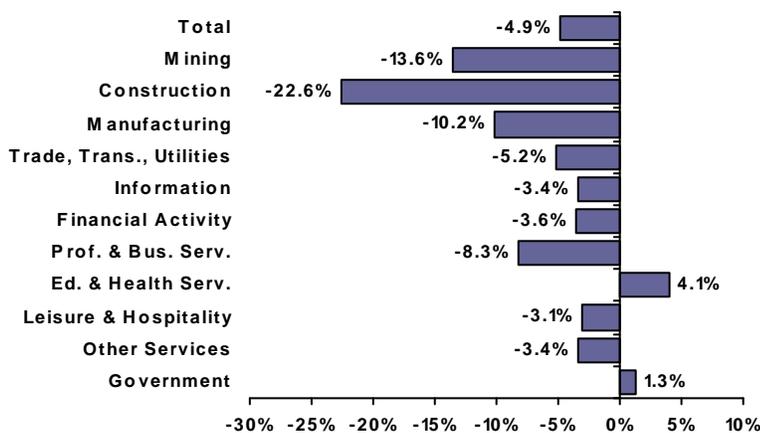

Demographics. Utah's population grew by 42,310 people, or 1.5%, during 2009, to just

Figure B. Percent Change in Utah Employment by Industry: 2009

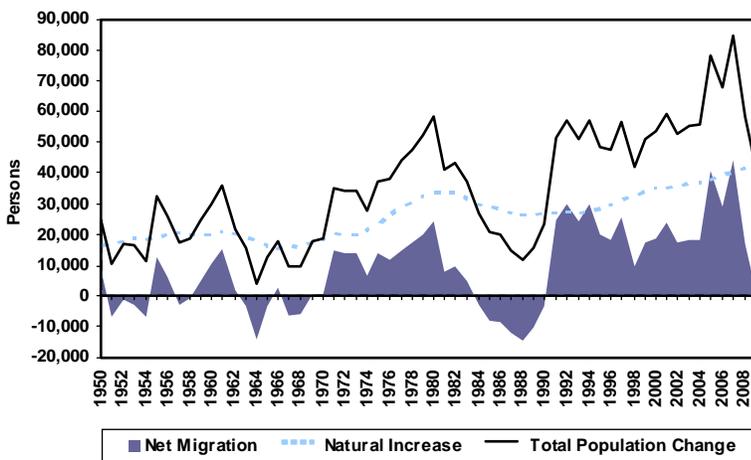

Source: Utah Department of Workforce Services

over 2.8 million. This growth was down from 58,225 in 2008, and a record 84,425 in 2007. Reflecting the difficult times, just 3.7% of the growth in 2008, or 1,547, was from net migration. Over the past decade, net migration accounted for about 35% of population growth, indicating the state's rich opportunity. Utah continues to have a distinctive demographic profile that includes the nation's youngest population, highest fertility rate, largest household size, and low mortality rates. According to the U.S. Census Bureau, Utah was the second fastest growing state in the nation during 2009 with a rate of 2.1%. Wyoming ranked first followed by Utah, Texas, Colorado, and the District of Columbia.

Labor Market. Nonfarm payroll employment declined 4.9% in 2009, almost 61,000 jobs, while the unemployment rate increased to 6.5%, and total wages fell almost \$2 billion, or 4.1%. Of Utah's ten major private sector industries, the edu-

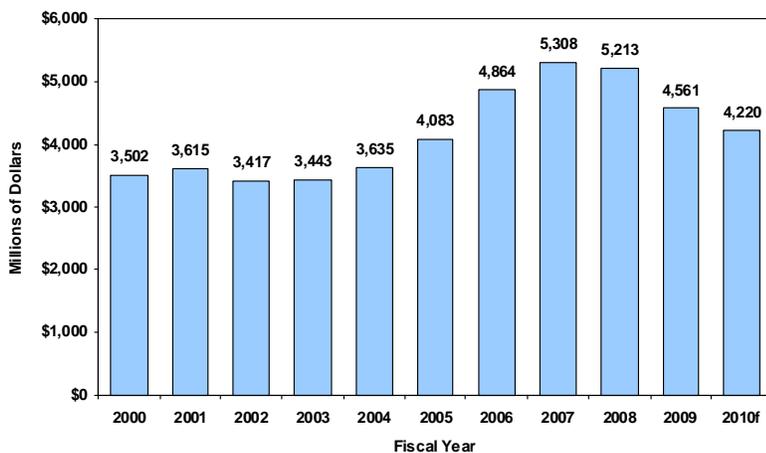

cation and health services sector was the only one to gain employment, growing 4.1% during 2009. Supported by ARRA assistance for education, law enforcement, transportation, and other critical public services, government employment grew 1.3%, but with deteriorating tax revenues, growth is expected to be just 0.5% during 2010. With the housing collapse, construction lost the most jobs in 2009, over 20,000, which was a decline of over 22%. Because of the sharp fall in energy prices, mining, which is mostly oil and gas extraction, posted the second largest percent decline, 13.6%. Slumping demand for consumer durables such as cars and household appliances and the retrenchment in business investment lead to a decline of almost 13,000 jobs in manufacturing, the second largest amount. The decline in consumer confidence and spending which resulted from the uncertainty surrounding the financial crisis, led to the third largest, a decline of almost 13,000 jobs in trade, transportation and utilities.

Figure C. State of Utah Components of Population Change

Source: State of Utah Components of Population Change

Figure D. Utah State Government Tax Revenue

Source: Governor's Office of Planning and Budget

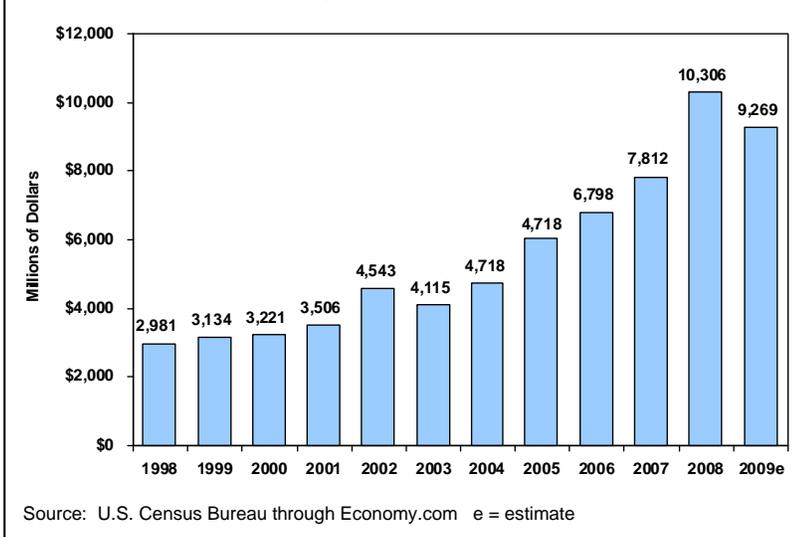

Personal Income. Personal income fell \$1.1 billion, or 1.3% during 2009, from \$87.4 billion to \$86.3 billion. The 4.1% decline in wages, the largest component of personal income, was offset by increases in government transfer payments such as unemployment insurance, to soften the overall contraction.

Gross Domestic Product by State. Utah's GDP grew 4% during 2008, from \$105.6 billion to \$109.8 billion. While Utah grew more rapidly than the nation, the gain in 2008 was substantially lower than in 2007, when the state had the fastest growth in the nation.

Taxable Sales. After declining 0.7% in 2008, taxable sales declined a record 8.7% in 2009, and are expected to grow only 0.4% in 2010. Of the three main components, business investment had the largest rate of decline in 2009, 12.3%, followed by retail trade, 8.3%. Sales of taxable services, the third component, actually increased 0.2%.

Tax Collections. With the deepening recession, tax collections declined a record 12.5% during FY2009. The state's two main sources of revenue, the sales and income taxes, suffered from lower consumer confidence and spending, and the resulting rise in unemployment. Sales tax revenue declined 11%, after declining over 6% in FY2008. The income tax declined almost 11% after a slight increase in FY2008. The third largest revenue source, corporate income tax, sank over 35% as corporate profits collapsed. The outlook for FY2010 continues the drop off in collections, but the rate of decline slows to 7.5%. Each of the three taxes is expected to decline, sales almost 8%, income almost 5%, and corporate 22%.

Figure E. Exports Down but Still Strong

Exports. Utah's exports fell 10.1% from a record \$10.3 billion in 2008 to an estimated \$9.3 billion in 2009. Exports have been above \$4.0 billion since 2002 and above \$6.0 billion since 2005. Record high levels in 2008 were primarily due to robust growth in the first quarter, dropping sharply as global demand slumped.

Inflation. The Consumer Price Index (CPI) for Urban Consumers declined 0.3% during 2009, the first annual decline since the recession following the Korean War. As economic activity picks up in 2010, the CPI is expected to increase 1.7%.

Regional/National Comparisons. While Utah has fared somewhat better than its neighboring states, total personal income fell during 2009 like every other mountain state. Employment levels in the mountain region also declined, largely driven by contractions in Arizona, Idaho, and Nevada. Utah's employment growth was one of the fastest in the nation between 2003 and 2008, but employment fell 4.9% during 2009, affecting the state's unemployment rate and poverty level. Utah still has one of the lowest unemployment rates in the nation, but it almost doubled from 3.4% in 2008 to 6.5% in 2009. Utah's poverty rate has decreased over time and in 2008 was significantly lower than the national average.

Social Indicators. Utah's quality of life measures continue to be among the best in the nation. The state's violent crime rate remained one of the lowest in the United States; the poverty rate is below the national average and educational attainment is one of the highest. Utah ranked second in the indicators of child well-being and second highest in overall health status.

Public Education. Public education enrollment increased 2.2% during 2009, or 12,260 students to 563,273. Enrollment is expected to grow another 11,044 students, or 2.0%, during

2010. While growth has been rapid the past few years, and the resources available are limited, Utah students score above the national average on standardized tests.

Higher Education. Enrollment in the Utah System of Higher Education has almost doubled over the past 20 years. In 2009, 12,632 additional students were enrolled, an increase of 8.3% from 2008. Almost 27,000 degrees were awarded within the state system, including nearly 13,000 bachelor's degrees.

Economic Development. Despite the recession, Utah maintained a smart, strong and vital economic development program. The Utah Science, Technology, and Research initiative continued to recruit research faculty. Construction progressed on research buildings on the campuses of the University of Utah and Utah

State University. Commercial applications of the research developments promise jobs and revenue for Utah's economy. The Governor's Office of Economic Development continued to attract companies to relocate to Utah and assist Utah companies in expanding operations in the state. Centers of Excellence awarded grants to 22 companies to help them bridge the gap between research outcomes and venture capital funding. The Downtown Rising and Falcon Hill projects continue to progress.

Industry Focus

Agriculture. Because of the fall in commodity prices, most agricultural sectors in Utah were less profitable in 2009 than in 2008 and 2007. Record or near record prices for milk, cattle and hay lead to near record agricultural cash receipts in 2008. As commodity prices firm, agriculture should be more profitable in 2010 than 2009.

Construction. The value of permit authorized construction in Utah fell 25% during 2009 to \$3.5 billion, the lowest since 1996. The sharp decline resulted from the severe contraction in nonresidential construction, which fell 37%, from \$1.9 billion to \$1.2 billion. In addition, the weakness of the residential sector continues although the residential decline appears to be slowing. In 2008 the value of residential construction dropped by 53% compared to 15% in 2009. The value of residential construction in 2009 was \$1.6 billion.

Residential construction units dropped from 20,500 in 2007 to 10,603 in 2008 and to 10,150 in 2009. The decline of the residential sector has been slowed by the unexpected jump in new apartment construction, which is up over 80%. The surge in apartment construction is due to the availability of financing. The federal government has provided loan guarantees for the development of new apartments thus spurring construction activity. In contrast, the value for new condominium and single-family detached housing is lower than in

2008, forced down in part, by the growing share of lower-priced homes and condominiums.

Energy. Although prices fell, Utah crude oil and natural gas production increased during 2009. Conversely, coal production decreased as some companies experienced difficult mining conditions, while other mines unexpectedly closed. Production of coal and natural gas continued to satisfy demand, while crude oil production, despite its recent increase, still accounted for only 44% of Utah's total consumption. Crude oil production in Utah has increased a remarkable 82% over the past six years, but imports from other states and Canada are still needed. After starting 2009 slightly higher than the lows experienced in late 2008, Utah's natural gas price decreased to the \$2 to \$3 per thousand cubic feet range and remained there for most of the year. In contrast, Utah's crude oil prices were at their lowest at the beginning of 2009, but steadily increased by year's end, possibly signaling a stronger economy for 2010.

Minerals. Utah's production of energy and mineral commodities declined \$2.6 billion, or 27%, from a record high \$9.4 billion in 2008 to \$6.8 billion in 2009, in real terms. The decline is mostly due to decreased base metal and industrial mineral values and decreased crude oil and natural gas prices. The decline of nonfuel mineral values, which peaked in 2006, in real terms, will likely be offset by the increased valuation of oil and gas in 2010. The value of Utah's production of non-fuel minerals ranks fourth in the nation.

High Technology. Employment in Utah's high-technology sector averaged almost 69,000 in 2008, an increase of 4.3%, or almost 2,900, from 2007. Total wages paid in the sector were almost \$4.6 billion, or 9.8% of all nonfarm wages paid in 2008. The average annual wage was over \$66,000, 76% higher than the state average. As the recession deepened, high tech employment began to decline early in 2009. Through the second quarter, employment declined 2.7% year-over. As the recovery strengthens, growth should resume during 2010.

Tourism. Utah's travel and tourism sector was not immune to the economic recession, but regional and in-state travel helped to soften the downturn. The Utah ski industry experienced the third best season on record. Visitation increased for the third year in a row at national parks. State park visitation was also up. The outlook for 2010 is cautiously optimistic with expectations that travel among in-state and domestic

leisure travelers could increase. There are still concerns about the weak economy, rising unemployment, the housing market, stock market uncertainty, and transportation weakness, but industry experts have forecast limited growth in 2010.

Special Topics

Falcon Hill at Hill Air Force Base. Falcon Hill is the name given to a cooperative effort between the U.S. Air Force, the State of Utah, and several local governments. The Air Force has launched an Enhanced Use Lease project at Hill Air Force Base known as Falcon Hill National Aerospace Research Park. Road construction is expected to begin in December, 2009 and work on the first commercial building will begin shortly after. During the next 20 years, an investment of \$600 million in buildings and land, plus \$23 million in equipment is possible, generating over \$100 million in property taxes. Ultimately almost 20,000 people could be directly employed by businesses operating at Falcon Hill.

Revenue Forecasting and the Utah State Budget. Utah, like most states, must balance its spending with forecast revenue. A revenue forecast models the relationship between the economy and the tax system. These models rely on mathematical methods, historical trends, and analytical judgment to form a reasoned expectation of future revenue collections upon which budgets are developed. The simplest way to measure accuracy is the difference between forecast and actual. Focusing on the shortest forecast window (i.e., the February Legislative Session forecast for the current fiscal year ending in 135 days), on average, the forecast has underestimated growth by about 2.5%. Over this period, average growth was 8.5% while the average forecast was 5.8%. Volatile sources of revenue were under-forecast by larger amounts. The difference in actual and forecast growth was -2.5% for sales tax, -1.5% for the general fund, -1.2% for individual income tax, -10.3% for corporate tax, -2.7% for the school fund, and -0.5% for the transportation fund.

Housing Update. Utah's housing sector likely reached the bottom of the sharpest decline in history during 2009. A decreased supply of complete unoccupied homes and declines in mortgage rates were offset by rising foreclosures, industry consolidation, and further declines in permits. Utah homebuyers took advantage of record low interest rates, state and federal government stimulus, and declining prices that together created a tremendous improvement in affordability, which is likely to continue into 2010.

Economic Outlook

Overview

While the official determination may not be made for a year or more, the recession that began in December 2007 appeared to have ended during the second or third quarter of 2009. After declining four consecutive quarters, U.S. Gross Domestic Product (GDP) grew 2.2% during the third quarter of 2009. Most indicators of economic activity dropped sharply during the first half of 2009, but stabilized and began to increase during the second half. What initially appeared to be a relatively mild decline, similar to the recessions of 1991 and 2001, changed radically with the failure of the Lehman Brothers investment bank in September 2008. For the rest of that year, and throughout 2009, the Federal Reserve and other central banks took unprecedented steps to ease credit conditions, slowing the contraction. Likewise, national governments around the world initiated massive fiscal stimulus programs, led by the \$787 billion American Recovery and Reinvestment Act (ARRA). As 2010 opens, expansionary monetary and fiscal policy support recovery in both the U.S. and global economies.

Summary of Economic Conditions in 2009

During 2009, the main challenge confronting policymakers was preventing financial collapse and an ensuing calamity similar to the Great Depression of the 1930s. Although the unemployment rate was near 10% at the end of the year, the fact a full scale depression was avoided is no small success. As credit standards tightened and consumer spending declined in the fall of 2008, businesses were unable to meet payroll, resulting in a wave of lay-offs not seen since the recession of 1982. Wholesale funding dropped sharply as lenders re-evaluated risk, putting many large financial firms near insolvency. Banks that prudently reduced exposure to sub-prime mortgages during 2007, such as JP Morgan and Goldman Sachs, entered 2009 relatively unscathed. While policy prevented a chaotic dissolution of the financial system, the labor market worsened dramatically. Confidence returned to businesses and consumers during the second half of the year and the labor market stabilized, albeit at a high level of unemployment.

As of October, 2009, U.S. nonfarm payroll employment declined 3.9% from the prior year. On an annual average basis, however, the decline was 4.3%, the largest drop in over 70 years. Construction and manufacturing had the largest rates of annual decline in employment, 14.2% and 11.3%, respectively. The decline in construction was initiated by the housing collapse, but as the recession deepened, falling business investment extended the losses. With an uncertain outlook at the beginning of the year, consumers delayed durable purchases on items such as cars and home appliances, which led to the fall in manufacturing. The decline in production reduced the need for temporary help, leading to a 9.9% decline in administrative and support services. The decline in sales reduced the need for shipping, leading to a 6.7% decline in

transportation and warehouse jobs. While wholesale and retail sales fell more than production during 2009, much of the necessary reduction in labor was accomplished by cutting hours, as opposed to jobs. Nonetheless, employment in wholesale and retail trade declined 5.0% and 4.4%, respectively. Despite the widespread contraction in employment, production, sales, and income, health care employment increased 1.8%. Health care is relatively insulated because much of its activity is government funded and private sector health plans continued to function even as employment was falling. Arts, entertainment and recreation declined 3.8%, while accommodations and food services fell 2.4%. Federal employment increased 1.7%, while state and local government employment fell 0.8%. Notwithstanding employment growth in a few select sectors, the labor market as a whole experienced the largest employment decline since the 1930s.

Significant Issues

Recession Dating. The National Bureau of Economic Research (NBER) is the body officially responsible for dating recessions. The end of economic expansion and the beginning of recession is known as the business cycle peak. In November 2008, NBER dated the peak of the last expansion and the beginning of the current recession as December 2007. The beginning of economic expansion, or recovery, and the end of recession is known as the business cycle trough. NBER will wait to date the trough of the current recession until the recovery has progressed far enough so that a subsequent downturn is a separate recession, as opposed to a temporary pause in the current contraction. While a common rule of thumb defines a recession as two consecutive quarters decline in GDP, NBER uses a variety of data and the collective judgment of a committee of expert academic economists to date peaks and troughs. In addition to their insight, NBER's experts use four main indicators of monthly economic activity to date recessions:

- Nonfarm Payroll Employment
- Personal Income less Transfer Payments
- Industrial Production
- Manufacturing and Trade Sales

Three of the four indicators—employment, income, and production—were at or near peak in December 2007. Sales, however, peaked 3.0% above its December level during July 2008, but then declined more rapidly than the other three indicators through the fall and into 2009. By May 2009, sales had declined almost 17% below the December 2007 level, but have since rebounded. Production declined almost 15% below peak, bottoming in July 2009, and beginning a strong recovery. Income has declined almost 8.0% below peak and has not begun to recover. Employment is down over 5.0% and is still declining, though at a slower rate. Based on these indicators, NBER will likely date the trough sometime during summer 2009, but will wait to make that determination until all the indicators depict an expanding economy.

Supervisors Capital Assessment Program. During winter and spring 2009, the Supervisors Capital Assessment Program (SCAP, commonly referred to as the “bank stress tests”), evaluated the strength of the nation’s 19 largest financial institutions, those with assets exceeding \$100 billion. For the group as a whole, the assessment found the banks were well positioned to withstand a deeper recession than is currently anticipated. Several institutions, notably Bank of America (BoA) and Citigroup (Citi), were directed to raise more capital to bolster their reserves in case losses mounted. Signaling the end to the crisis may be near, both BoA and Citi easily raised the required capital from private sources. The conclusion of the assessment brought a degree of predictability to wholesale funding markets, though credit for small and medium borrowers remained hard to get throughout 2009.

Housing. After a collapse that began late in 2005, housing stabilized over the summer, and is beginning to recover as 2010 opens. The current housing downturn is the worst in the last 60 years. Residential investment was 2.5% of GDP in 2009 and is expected to increase to just 2.6% in 2010, the lowest levels since the height of the World War II build-up and the depths of the Great Depression. While sales, starts, and prices have begun to increase, foreclosures are still rising. Almost 3.0 million homes were foreclosed during 2009, a level equal to about half of home sales. Since foreclosures will not fall significantly until unemployment stops rising, these forced sales could continue to weigh on housing.

There are at least three widely followed home price measures:

- Standard and Poor’s Case-Shiller Price Index
- Federal Housing Finance Agency (FHFA) Price Index
- National Association of Realtors (NAR) Home Sales Price

Typically the median price is reported: half of homebuyers pay more than this price, half pay less. The average is also reported, but this can be skewed by high-priced homes that do not reflect the cost to most home buyers. Because the average can be skewed, most observers prefer the median. Unlike simple commodities such as an apple or a gallon of gas, very few houses are exactly the same. Estimating the change in home prices from one month to the next does not reflect sales of the same product. Case-Shiller makes the most determined effort to estimate what the same product would sell for. FHFA only includes mortgages from the portfolios of FreddieMac, and FannieMae. Both Case-Shiller and FHFA are indexes, as opposed to actual prices, constructed from repeat sales of the same home. In any given month, the index is based on sales of a group of homes compared with previous sales of that same group. In contrast, NAR simply reports the median price of all homes sold in a given period, in dollars, as opposed to an index. While the NAR price is not tracking the exact same product, the median-priced home from one month to the next will be fairly constant in quality. NAR also has the advantage of being

reported in dollars, which enables comparison to income and estimates of housing affordability.

Home prices have fallen between 10%, according to FHFA, and 35%, according to Case-Shiller, since peaking in 2006. Prices fell about 5% during the first half of 2009, but retraced the loss in the second half to end the year about where they began. For the year as a whole, prices in 2009 are between 5% and 15% lower than 2008, depending on the measure. While the precise estimate varies, home prices have fallen sharply since the peak, but stabilized during the spring of 2009 and began increasing during the summer. Since prices have stabilized, home construction has moved up from post-World War II lows, with single family housing starts increasing from 357,000 in February (seasonally adjusted at an annual rate), to 564,000 in December.

Monetary Policy. With the financial system gripped by a panic as 2008 closed, the Federal Reserve sharply increased its provision of short-term liquidity to financial institutions, the U.S. Treasury injected capital into banks through the Troubled Asset Relief Program (TARP), and the Federal Deposit Insurance Corporation (FDIC) guaranteed bank liabilities. The Federal Reserve and the Treasury each took measures to stop a run on money market mutual funds that began when a leading fund was unable to pay off its investors at par value. As the panic progressed, a range of additional initiatives were required to stabilize major financial firms and markets, both in the U.S. and abroad.

The money markets were quickly stabilized after government intervention, wholesale short-term funding through repurchase agreements (“repo”) collapsed in a classic bank run during the fall of 2008, and has not yet resumed. The run is pictured in the steep decline of repo funding available to the Federal Reserve’s primary dealers, from \$4.2 trillion at Lehman’s failure, to \$2.4 trillion at the beginning of 2009, a level it fluctuated around throughout the year. In other words, a major source of funding to the wholesale banking sector shrank by almost half during the fall of 2008. As a means to restore liquidity, the Federal Reserve created a number of lending facilities. The largest were the Term Auction Facility (TAF, auction loans to reserve system banks), securities lending (collateral for repo), and central bank swap lines (satisfying overseas demand for dollar liquidity). As 2009 progressed, the need for liquidity fell, the lending facilities wound down, and focus shifted to supporting the mortgage and treasury markets. In the six month period from spring to fall, the Federal Reserve purchased \$300 billion of treasury securities, dramatically smoothing the market. During the same period, it purchased \$800 billion of mortgage backed securities, with an ultimate goal of \$1.25 trillion by spring of 2010, which has sustained the flow of mortgage finance. Throughout the year, the Federal Reserve maintained the federal funds rate near zero. In normal times, keeping short term lending rates near zero would attract widespread commentary, but given the nature of the financial crisis, the low rate passed with little notice.

While credit has improved for large firms and state and local governments with access to equity and bond markets, access to credit remains strained for borrowers who are particularly dependent on banks, such as households and small businesses. Bank lending contracted sharply during 2009, and banks continue to tighten the terms on which they extend credit for most kinds of loans—although the pace of tightening has slowed recently. Partly as a result of these pressures, household debt declined for several quarters, for the first time since 1951. Further, credit lines for many small businesses have been reduced or eliminated. The fraction of small businesses reporting difficulty in obtaining credit is near a record high, and many of these businesses expect credit conditions to tighten further.

Financial regulators, led by the Federal Reserve, Congress and the Obama Administration are deeply concerned about the commercial real estate market. The regulators are encouraging lenders and borrowers to develop workout programs for loans backed by distressed properties. Almost 150 banks failed during 2009, more than in any year since 1992, many because of non-performing commercial loans. Some observers feel the amount of bad commercial debt exceeds the amount of bad mortgage debt, so the challenges over the next few years could be greater. Although the specifics are currently under discussion, a consensus is emerging that the federal government will need to create a number of new programs to address problems in commercial real estate and elsewhere. While the financial system has stabilized, and is beginning to return to normal, it will continue to need support for the foreseeable future.

Fiscal Policy. The most important part of U.S. fiscal policy is the federal budget, but state and local government budgets play a significant and, during the current downturn, countervailing role. For its fiscal year 2009 (October 1, 2008 to September 30, 2009), the U.S. government's deficit was the largest on record, in absolute amount, and the largest as a percent of GDP since the peak of the build-up for World War II during 1944. State and local governments, however, have experienced steep declines in revenue, and have made correspondingly deep cuts in spending. To maintain public services, many entities are raising taxes, which will slow the decline in program funding, but will not restore it. Nonetheless, considered as a whole, the budget deficit for federal, state, and local government is highly expansionary.

At the height of the New Deal, the combined federal, state and local deficit reached 4.1% of GDP, matching, but not exceeding, the level from 1931. Thus, relative to GDP, the New Deal was a conscientious decision to continue deficit spending at the level that unintentionally resulted in 1931, when tax revenue collapsed, but government programs continued to operate at pre-Depression levels. With the economy on a full-scale war footing, the deficit reached 24.3% in 1944. During the cold war build-up of the 1980s the deficit exceeded 5.0% in a few years. Likewise, during recovery

from the 1991 and 2001 recessions the deficit exceeded 5.0%. At 10.1% of GDP, the deficit in 2009 is unprecedented absent full scale mobilization for war. Further, as ARRA spending accelerates, the deficit is expected to continue near 10.0% in 2010—more than twice the level during the 1930s.

Many economists feel the current deficits will speed a self-sustaining recovery. However, sizable numbers of well-regarded observers from opposite sides, feel the deficit is either too small or too large. Those who feel the deficits are too small argue the federal government should do more to help state and local governments maintain education, public safety, health, transportation, and other critical services. Those who feel the deficits are too large argue a measured combination of tax cuts and targeted spending is helpful, but the magnitude of the current program is excessive and is likely to initiate an unsustainable fiscal trajectory that will ultimately lead to a correction prolonging and deepening the current downturn.

The “cash-for-clunkers” program has been widely reported in the media as a support for recovery, but the fact that it is an example of fiscal stimulus is not usually noted. Motor vehicle sales and production collapsed in the fall of 2008. During January 2009, vehicle production fell to 3.8 million units, at a seasonally adjusted annual rate, the lowest level in the history of the series, and remained below 5 million until cash-for-clunkers was implemented. During August, as the program was expiring, sales spiked to 14.3 million, but fell below 10.0 million in September after the program expired. October sales were just above 11.0 million, which supports production levels above 7.0 million, and suggests a strengthening recovery. Most observers feel the program provided helpful support to stop the decline in production and sales, but going forward the auto sector will return to a normal growth path without the need for further stimulus.

Fearing the housing sector would falter without continued stimulus, Congress extended the home buyer credit from November 30, 2009 to June 30, 2010, and expanded it to include existing homeowners and upper middle income families. This credit is another major example of a program widely reported in the media, but not as a tool of fiscal policy. As with cash-for-clunkers, most observers feel the program helped stop the collapse, but unlike the auto sector, the housing sector still needs temporary support for its recovery to progress.

2010 Outlook. The consensus outlook is for moderate growth in output during 2010, with a two or three quarter lag in the labor market. For the year as a whole, average annual employment is expected to decline 0.9%, or 1.2 million jobs, while GDP increases 2.2%. Because of slow business investment and lagging home building, construction will lose almost 650,000 jobs, a decline of 10.5%. Consumer uncertainty will dampen the demand for durables while business slows equipment purchases, leading to manufacturing job losses of

425,000, a decline of 3.6%. As the expansion proceeds, firms will initially be cautious to hire full-time employees, which will boost temporary administrative and support jobs by 439,000, or 6.0%. On a quarterly basis, hiring will accelerate during the second quarter, when job gains reach 80,000 per month, in contrast to losses of about 100,000 per month in the fourth quarter of 2009. By the end of 2010, job gains are expected to run over 100,000 per month. With the pace of job losses slowing in the first half, and job gains accelerating gradually in the second half, the unemployment rate is expected to exceed 10.0% throughout the year.

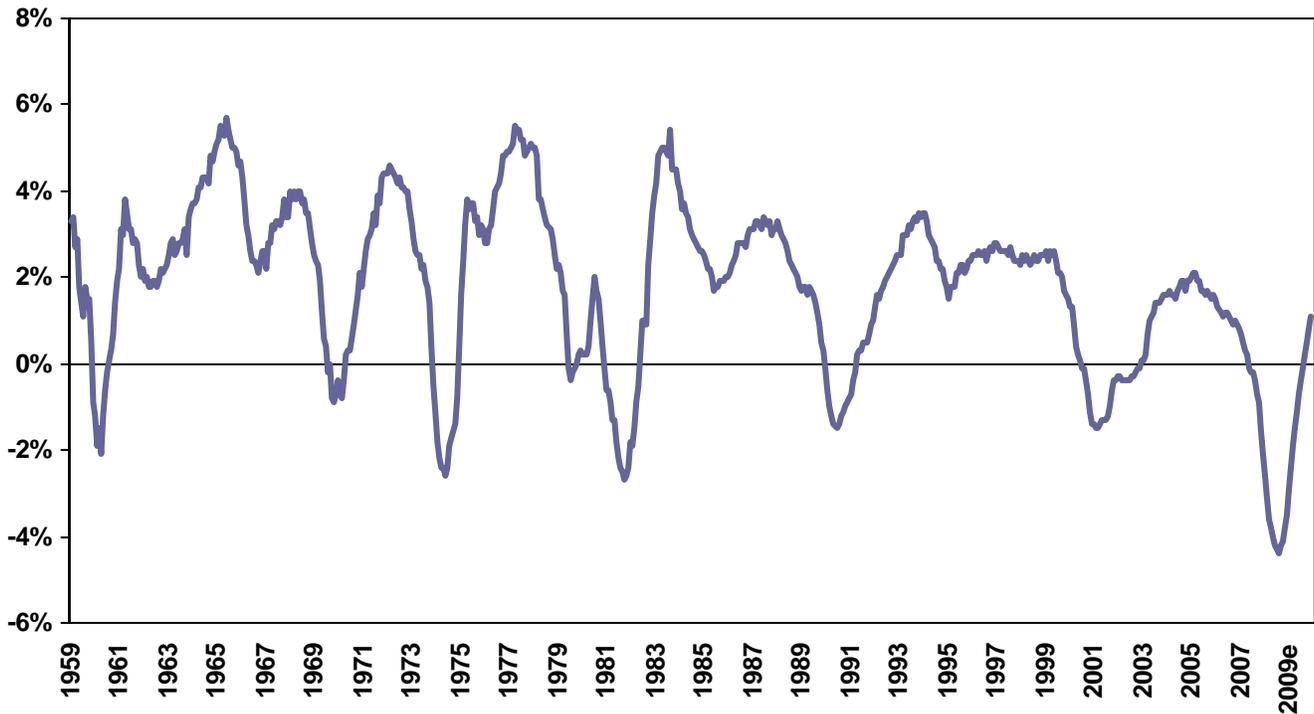

If the consensus is correct, 2010 will end better than it begins. Much of the damage to the financial system will be repaired, with credit-worthy borrowers able to finance their projects. The economy will remain well below its potential, the level at which resources are fully utilized and prices are stable, throughout the year. Most large firms and state and local governments will be able to obtain credit on reasonable terms. Once lending to small business resumes, accelerating

growth in both output and employment will move the economy towards potential. Impending problems in commercial real estate and elsewhere, as well as continuing problems in housing, may require an expansion of the Federal Reserve's balance sheet, as well as new programs in the FDIC and Treasury. The policy environment will remain daunting in 2010, but there are prospects for growth.

Conclusion

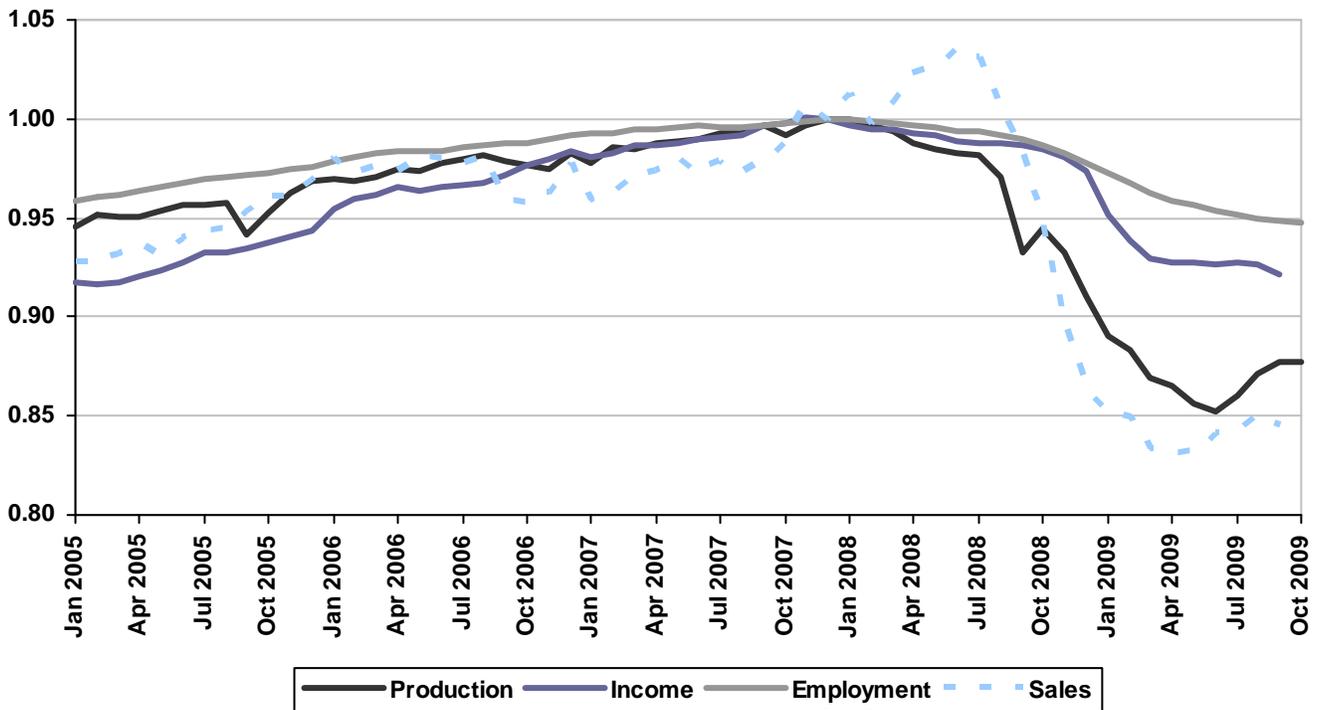

Most indicators suggest the recession ended during the second or third quarter of 2009. After four quarters of decline, GDP grew 2.2% in the third quarter. While GDP is growing, job losses continue. Job gains of 100,000 per month should begin in the first or second quarter of 2010, when the expansion takes hold. After a panic in wholesale money markets, the financial system has stabilized, though credit remains tight for households and small businesses. As the recovery progresses, the policy environment will improve, and the extraordinary measures put in place at the height of the crisis will gradually be removed.

Overview

At the beginning of the national recession, December 2007, Utah was growing normally. The year-over percent change in employment was 3%, the historic average, but much higher than the 0.8% U.S. growth rate. The state fared well during the initial phase of the contraction because its housing prices had not inflated to the extent of places like Las Vegas and Phoenix. Moreover, as the U.S. economy expanded following the 2001 recession, the Wasatch Front, Cache Valley, St. George, and Cedar City attracted national attention as good locations for business. The state had a relatively diverse and stable economic base, with less exposure to housing and commercial real estate than the rest of the country at the beginning of the recession. However, as the financial crisis intensified in the fall of 2008, Utah began to track the national downturn. While the economic environment was daunting throughout 2009, the advantages of doing business in Utah that drove growth before the recession still exist and will contribute to Utah's ultimate recovery.

2009 Overview

By October 2009, Utah's unemployment rate increased to 6.5%, from 3.4% a year earlier. During the same period, the national unemployment rate increased to 10.2% from 6.6%. In terms of unemployment, Utah's labor market is in much better shape than the nation's. As the unemployment rate rose, the rate of change in employment fell, turning negative in both the U.S. and Utah. Based on preliminary estimates from the Bureau of Labor Statistics (BLS), year-over for October, employment in Utah fell 3.9%, compared to 3.9% in the U.S. Early releases of actual counts by the Utah Department of Workforce Services suggest the average annual employment decline was about 4.9% during 2009, or a loss of almost 61,000 jobs. Though still preliminary, BLS seasonally-adjusted employment for Utah began to grow in September.

Because of the housing downturn construction lost the most jobs during 2009, over 20,000, in addition to 13,000 during 2008. At over 20%, construction also had the largest rate of decline during 2009. After booming during the run-up in energy prices since 2003, mining employment, principally oil and gas, declined almost 13.6%, or 1,700 jobs. With the national decline in consumer durable purchases and business investment, manufacturing declined 10.2%, almost 13,000 jobs. As sales declined, the demand for temporary help and telemarketing in business and professional services fell, resulting in a decline of 8.3%, or over 13,000 jobs. Troubles in real estate and banking led to a 3.6% decline in finance, over 2,500 jobs. The health care and education sector had the largest gains, an increase of 4.1%, or almost 6,000 jobs. Jobs with the federal government increased, as did jobs in public and higher education.

Gross domestic product (GDP) is the broadest measure of state economic activity, but is only available on an annual basis for 2008. Because personal income is available quarterly

for the current year, it is often used in place of GDP. During 2009, Utah personal income declined 1.3%, with total wages, its largest component, declining 4.1%. Dividends, interest and rent declined 8.4%, but this was more than offset by an 11.6% increase in government support payments such as unemployment insurance, temporary assistance to needy families, and food stamps.

While the decline in total wages was the largest on record, the decline in employment was even greater. The result was a 0.8% increase in the average wage. In normal times, inflation, as measured by the consumer price index (CPI), increases around 2%. During 2009, however, global deflationary pressures were so strong that the CPI declined 0.3%. The net result was even though Utah's nominal average wage grew less than 1%, because the CPI declined, the real inflation-adjusted average wage increased 1.1%. As a percent of the nation, Utah's average pay has ranged between 80% and 85% since 1990.

Significant Issues

Housing. While it was not as adversely affected as states like Nevada, California, Florida and Arizona, the national housing correction is affecting Utah. Essentially all of the local correction occurred during 2008, when housing permits fell almost 50%, from just over 20,000, to just over 10,000. During 2009, both housing permits and prices were flat. Utah home prices are measured by the Federal Housing Finance Agency (FHFA) and the National Association of Realtors (NAR), which reports prices for the Salt Lake metropolitan area. Case-Shiller has no reporting in Utah. In addition, Economy.com estimates median prices by county and the state, and the Utah Association of Realtors (UAR) reports average selling price. By any of these measures home prices have fallen around 10% since peaking in 2007, and appear to have stabilized during 2009.

In March 2009, the State of Utah created the Home Run program to help clear the oversupply of newly constructed homes and stimulate construction employment. Initially, \$10 million of discretionary American Recovery and Reinvestment Act (ARRA) funding was allocated to provide \$6,000 grants to eligible home buyers for the purchase of newly constructed homes. Within three months, approximately 1,700 grants were distributed leading to over \$375 million in home sales. Because of the initial success, in September, Governor Herbert allocated another \$8 million in discretionary ARRA funds for a second phase of the program, which offered \$4,000 grants. The second round of funding ended just two months later, in November, with almost 2,000 grants to eligible home buyers. Combined with the federal home buyer tax credit, Utah's Home Run program has provided critical support to the housing sector.

As the housing boom accelerated during 2006, the growth rate of construction employment reached 16.3%. At the peak of the boom, during 2007, there were more than 103,000

construction jobs, an increase of 8.7% from 2006. As the housing market collapsed, construction employment declined over 12% in 2008, and over 22% in 2009. As a percent of total employment, construction jobs peaked at 8.3% in 2007, and have since fallen below the long-term average of 5.8%. By 2010, construction employment will have fallen over 40% from the peak, to about 60,000 jobs.

Motor Vehicle Sales. The high level of uncertainty during the panic of fall 2008 led consumers to cut back on all optional spending. Durables, such as cars and household appliances, experienced particularly large declines. In Utah, motor vehicle sales peaked in June and July 2005 at over 12,000 units sold. From 2006 to fall 2008, sales averaged above 8,000 units per month, and were often above 10,000. Sales plummeted to 5,100 units during November 2008 as the financial crisis intensified, bottoming at 4,000 in February 2009, during the height of uncertainty. Throughout the first half of 2009, units sold remained below 6,000. The cash-for-clunkers program boosted sales to 7,600 in August.

Selected Job and Project Announcements. Despite the recession, numerous companies have announced local expansions. Ebay, Goldman Sachs, Microsoft and Kohl's are national firms choosing to expand in Utah. Two billion-dollar projects, City Creek Center and the National Security Agency (NSA) data center, are underway. City Creek is midway through a massive reconstruction of downtown Salt Lake City, on schedule to finish in 2012. The NSA data center is in the planning stage, with construction expected to begin in 2010 or 2011. About ten transportation projects worth several billion dollars are under construction or scheduled to begin in 2010 or 2011. The Utah Transit Authority will be completing TRAX lines in Salt Lake County, and FrontRunner service from Salt Lake City south into Utah County. The Utah Department of Transportation is scheduled to begin I-15 Core in Utah County during 2010, with a total project cost of \$1.5 billion. Construction on Mountain View Corridor in western Salt Lake County is scheduled to begin in 2010 at a cost of \$480 million.

Rankings. According to Gallop, Utah is the best place in the nation to lose your wallet. In Gallop's survey, 85% of Utahns trust their neighbors, and would expect them to return a lost wallet containing \$200. Researchers have found the trust question has economic implications. States with high levels of trust, such as Utah, also tend to have higher levels of overall well-being. While no direct link between well-being and economic performance has been indisputably established, it is surely no accident the American Legislative Exchange Council ranks Utah the state with the best economic outlook. Forbes ranks Provo the third most attractive

city in the nation. Pollina ranks Utah the third most pro-business state. Governing Magazine ranks Utah the best managed state in the nation. The Tax Foundation ranks Utah the 10th best small business tax climate.

2010 Outlook

The current expectation is Utah's recovery will parallel the nation's. While U.S. GDP is already growing, jobs are expected to lag a few quarters, so that national employment actually declines 0.9% on an annual average basis during 2010. Utah's employment is expected to decline 1.8% during 2010. Total wages will decline 0.3%, less than employment, so the average wage will rise 1.5%. With global economic activity accelerating, deflationary pressures will abate, resulting in a 1.7% increase in the CPI. Since the nominal average wage grows slightly lower than the CPI, Utah's real inflation-adjusted average wage will be minimal.

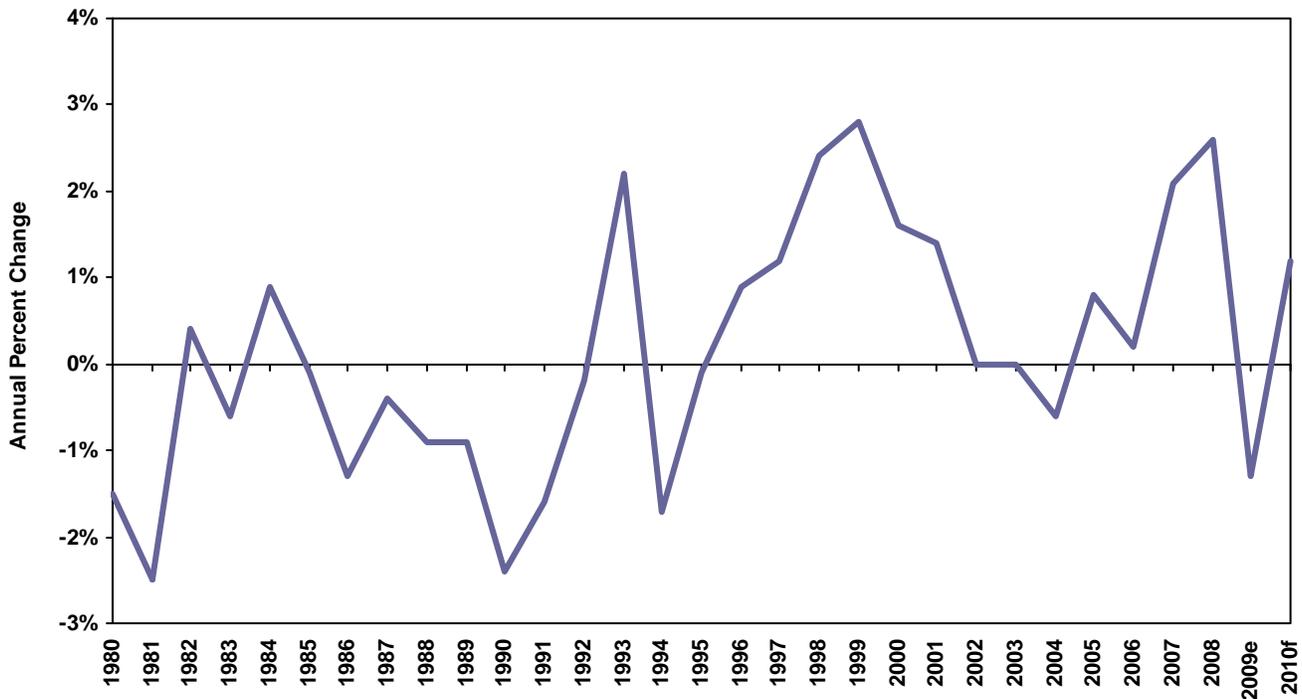

Construction, mining and manufacturing will continue to contract at a faster rate than the overall economy during 2010. With housing starts flat during 2010, and non-residential investment declining, construction employment will decline 13.6%. With energy prices below 2007 levels during 2010, mining employment will decline 7.4%. While the outlook is improving, consumers remain cautious about their spending, and businesses are hesitant to begin major investment projects. The result is slack demand for Utah's products, and a decline in manufacturing employment of 6.0%. On a quarterly basis, most of the decline in 2010 will occur in the first quarter, with employment in most industries growing as the year ends.

While still preliminary, the BLS estimate of employment growth since August suggests the Utah recovery could be stronger than currently anticipated. BLS estimates, which are based on a survey, are notoriously volatile during the peaks and troughs of business cycles. In July 2009, the survey had a year-over decline of 4.3%, which compared with the actual decline of 5.4%. Given this discrepancy, it seems unlikely the final data will show a 4.5% annual growth rate as 2010 begins, but the turn in the survey estimate is a good sign.

Conclusion

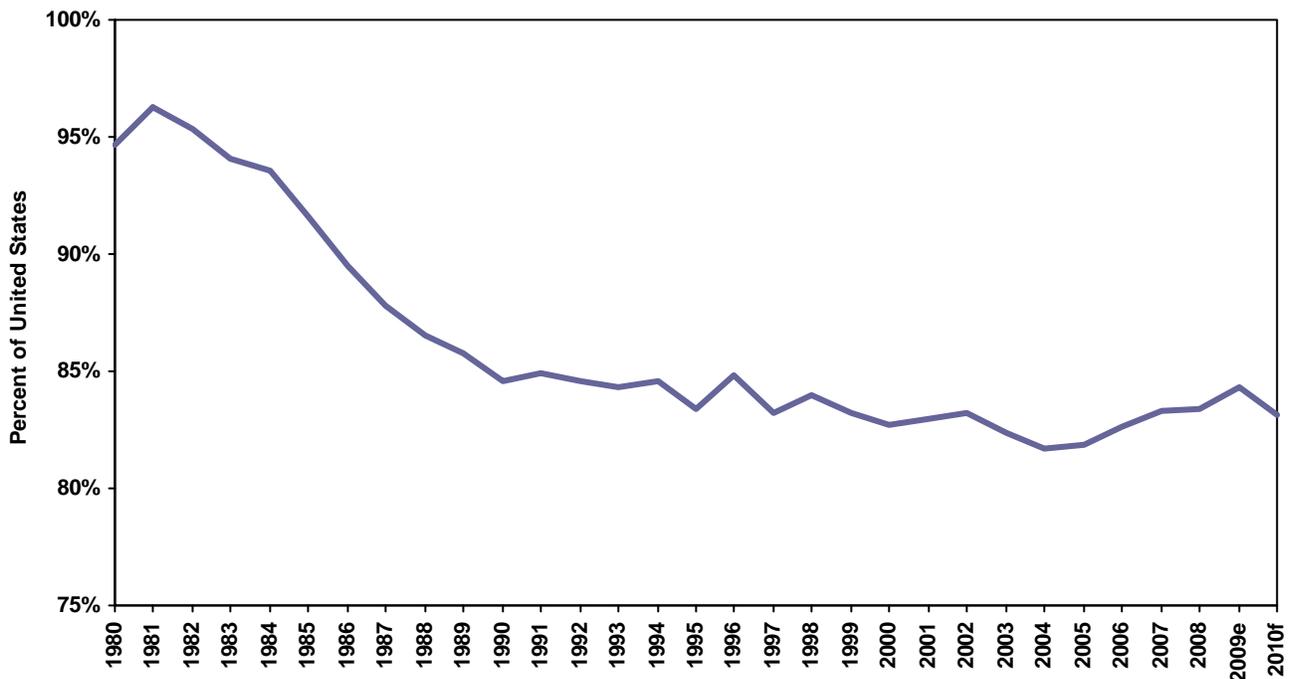

Utah has historically grown more rapidly than the U.S., especially during recoveries. The current downturn appears to be something of an exception with the rate of job decline in Utah a bit higher than for the U.S. By the fourth quarter of 2010, however, the rate of job growth in Utah will accelerate to 1.5%, more than 1% higher than for the nation. As recovery takes hold, and the national expansion begins, Utah's natural advantages as a western hub will drive strong growth for the state.

Utah's Long-Term Projections

Overview

Utah's population reached 2.2 million in 2000 and 2.8 million in 2009. It is expected to reach 6.8 million by the year 2060. The growth rate, which will exceed that of the nation, will be sustained by a rapid rate of natural increase and a strong and diversified economy. Employment will also grow strongly, providing jobs for the state's population. Additionally, the state's economy will increase in sophistication and diversification, becoming less reliant on manufacturing or extractive industries. As the state grows, new population centers away from the traditional centers along the Wasatch Front will begin to emerge.

Background. The 2008 Baseline Long-Term Projections were released in January of 2008 and therefore do not reflect any demographic or economic data produced after that time. Though the economic contraction led to slower-than expected growth during the closing years of 2000s, sustained growth is anticipated through 2060. The next baseline long-term projections are scheduled to be release in 2012. For additional information on historical as well as projected economic and demographic data, including methods, procedures, and assumptions, visit the web site www.governor.utah.gov/dea or email dea@utah.gov.

State Level Results

The 2008 Baseline demographic and economic projections were produced by the Demographic and Economic Analysis section of the Governor's Office of Planning and Budget (GOPB), in association with numerous state and local representatives.

Population. Utah's population, which was 1.7 million in 1990 and 2.2 million in 2000, is projected to reach 2.9 million in 2010, 3.7 million in 2020, 4.4 million in 2030, 5.2 million in 2040, 6.0 million in 2050, and 6.8 million in 2060. Although the projected average annual growth rate declines from 2.7% per year in the 2000s to 1.3% per year in the 2050s, these growth rates are more than twice the projected rates for the nation.

Natural Increase. Natural increase, which is the amount by which annual births exceed annual deaths, will be approximately 65% of Utah's population growth over the next 50 years. The number of births per year is projected to average 51,000 in the 2000s, 58,000 in the 2010s, 65,000 in the 2020s, 78,000 in the 2030s, 89,000 in the 2040s, and 98,000 in the 2050s. This compares to projected annual average deaths of 13,000 in the 2000s, 16,000 in the 2010s, 20,000 in the 2020s, 26,000 in the 2030s, 32,000 in the 2040s, and 39,000 in the 2050s.

Migration. Net migration is gross in-migration less gross out-migration. Net in-migration occurs when more people move into an area than move out for a given period of time.

Net in-migration is projected to occur in Utah over the next five decades. Approximately 1.7 million of the 4.6 million population increase over the 50-year projection period can be attributed to net in-migration, meaning in-migration accounts for about 35% of the projected increase. Net in-migration occurs when 1) there is enough job creation to accommodate residents who are new entrants to the labor force, and 2) there is additional job creation, such that in-migration is necessary to satisfy labor demand within the state. The sustained net in-migration is projected because job creation is also projected to be relatively rapid over the next three decades.

Age Structure and Fertility. A significant amount of attention has been paid to the trends of the growing school-age population in Utah. The growth spurt in this 5-to-17 age group occurs because the grandchildren of the Baby Boomers are now entering their school-age years. The State of Utah is projecting an increase of about 160,000 people in the school-age population over the next decade. This increase is not mainly fertility-driven or migration-driven; rather, it is primarily due to a significantly large number of women in their childbearing years. Utah's population is relatively young when compared to the nation. Consequently, a greater proportion of females in Utah are in their childbearing years than in the U.S. Therefore, even if Utah's fertility rate, children per woman, was equal to that of the nation, more children would be born in Utah relative to the size of the population.

In addition to the young population, Utah's women have higher fertility rates, ranking the state first among states nationwide. For the projection period, Utah's fertility rate is projected to remain constant at 2.5 children per woman of childbearing age. At the national level, the fertility rate is projected to increase from 2.01 in 2000 to 2.19 in 2050. Further contributing to the rapid rate of natural increase is the fact that Utahns tend to have longer life expectancies, and mortality rates at any given age are lower, compared to the nation.

Utah's median age is projected to increase from 27 years in 2000 to 36 years by the year 2060. Over the same period, the U.S. median age is projected to increase from 35 to 40. The increasing median ages in both cases are largely the result of the aging of the Baby Boomers over time. The difference in median ages reflects the cumulative effect of Utah's higher fertility rate and the interaction of this high fertility rate with the younger population profile of the state. As Utah women in childbearing years continue to have more children on average than women nationally, the younger age groups continue to be relatively larger as a portion of the population than is the case for the U.S. as a whole.

Dependency Ratio. One summary measure of a population's age structure is the dependency ratio. This ratio is defined as the number of non-working age persons (the population younger than 18 and 65 years and over) divided by the

number of working-age persons (ages 18 through 64). Historically, Utah's dependency ratio has been significantly higher than that of the nation. This has occurred because the preschool and school-age portions of Utah's population have been substantial, relative to its total population. In 1970, Utah's dependency ratio was 90 while the nation's was 79. In 2000, the dependency ratio for the state fell to 68 while the nation's fell to 61. In both cases, this decline occurred primarily because the Baby Boomers were of working age.

Utah's age structure is projected to continue to be characterized by a relatively high dependency ratio. However, the state's dependency ratio is projected to drop below that of the nation beginning in 2022 and remain below until 2050. In 2060, Utah's projected dependency ratio is 82.7, while the nation's is 82.

Employment. Utah's total employment, including self-employed and others not included in nonfarm employment, is projected to increase from 1.4 million in 2000 to 3.8 million in 2060. This is an increase of over two million jobs over the projection period. The State of Utah's average annual growth rate for the projection period is 1.7%, while the corresponding growth rates for the U.S. are projected to be about half that of Utah.

Over the next five decades, employment growth is projected for every major industry except natural resources and mining in Utah. Further, average annual growth in every industry is projected to be higher than for those same industries at the national level. National projections indicate that four of the 11 major industries will experience net declines in employment levels: natural resources and mining; manufacturing; trade, transportation, and utilities; and information. In Utah, education and health services is projected to have the highest average annual growth rate over the next five decades at 2.9%.

Currently, the three Utah industries with the highest actual employment are trade, transportation, and utilities; government; and professional and business services. Looking forward, the number of jobs in these industries is expected to more than double, increasing from 650,000 in 2000 to 1.5 million in 2060, an increase of approximately 850,000 jobs.

Diversification. The State of Utah is becoming more economically diverse, and hence more like the economic structure of the United States, as measured by the Hachman Index. The Hachman Index measures how closely the employment distribution of the subject region (Utah) resembles that of the reference region (United States). As the value of the index approaches one, this means that the subject region's employment distribution among industries is more similar to that of the reference region. There are specific counties that are very different from the U.S., which is not necessarily bad. For example, if the natural resources and mining industry moved out of Duchesne County, the economic structure of

the county would score higher on the Hachman Index, meaning it would now be more representative of the economic base of the nation. However, the county's economy would not be better off.

Although the direction of shifts in composition of employment by industry are projected to be similar for Utah and the U.S., the projected 2000 and 2060 distributions of employment by industry are different for Utah and the U.S. In 2001, the most significant differences between the industrial composition of Utah and the U.S. were the large concentration of employment in the construction and the financial activity sectors in Utah, as well as the somewhat large employment concentration in the information and government sectors. The concentration of employment in the trade, transportation, and utilities sector was slightly higher in Utah when compared to the nation. The Utah industries with smaller proportions of the overall employment than their national counterparts included professional and business services, leisure and hospitality, other services, manufacturing, education and health services, and natural resources and mining. The most significant differences between the employment shares for the projected industrial composition in 2060 of Utah and the U.S. are the relatively larger concentration of Utah's employment in the trade, transportation, and utilities and construction sectors, and the relatively smaller share of Utah's employment in natural resources and mining, private education, and health care.

County Level Population and Employment Projections

Population. About 60% of the state's projected population increase from 2000 to 2060, or 2.7 million of the 4.6 million new residents, will be concentrated in the counties of Salt Lake, Utah, Davis, and Weber. Despite this, the share of the state's population in these counties should decrease from 76% in 2000 to 64% in 2060 due to growth in other parts of the state.

Several counties are expected to have annual growth rates in excess of the state's annual growth rate of 1.9% over the next 50 years. These counties include Washington, which will grow at a rate of 3.8%; Morgan, at 3.8%; Wasatch, at 3.4%; Summit, at 2.9%; Tooele, at 2.9%; Iron, at 2.7%; Beaver, at 2.6%; Utah, at 2.3%; and Cache, at 2.2% from 2000 to 2060. In other words, these counties will gain in terms of their shares of the state's total population.

Employment. Of the 2.4 million net employment creation projected for the state from 2000 to 2060, 63.3%, or a total of 1.5 million jobs, are expected to be within Salt Lake, Utah, Davis, and Weber counties. Among these counties, Utah is the only county projected to have an average annual employment growth rate higher than the entire state.

The counties with the most rapid rates of projected employment growth are also those counties with rapid rates of projected population growth. Rapid employment growth makes

it possible for a region to support more people. Population growth reinforces economic expansion as well.

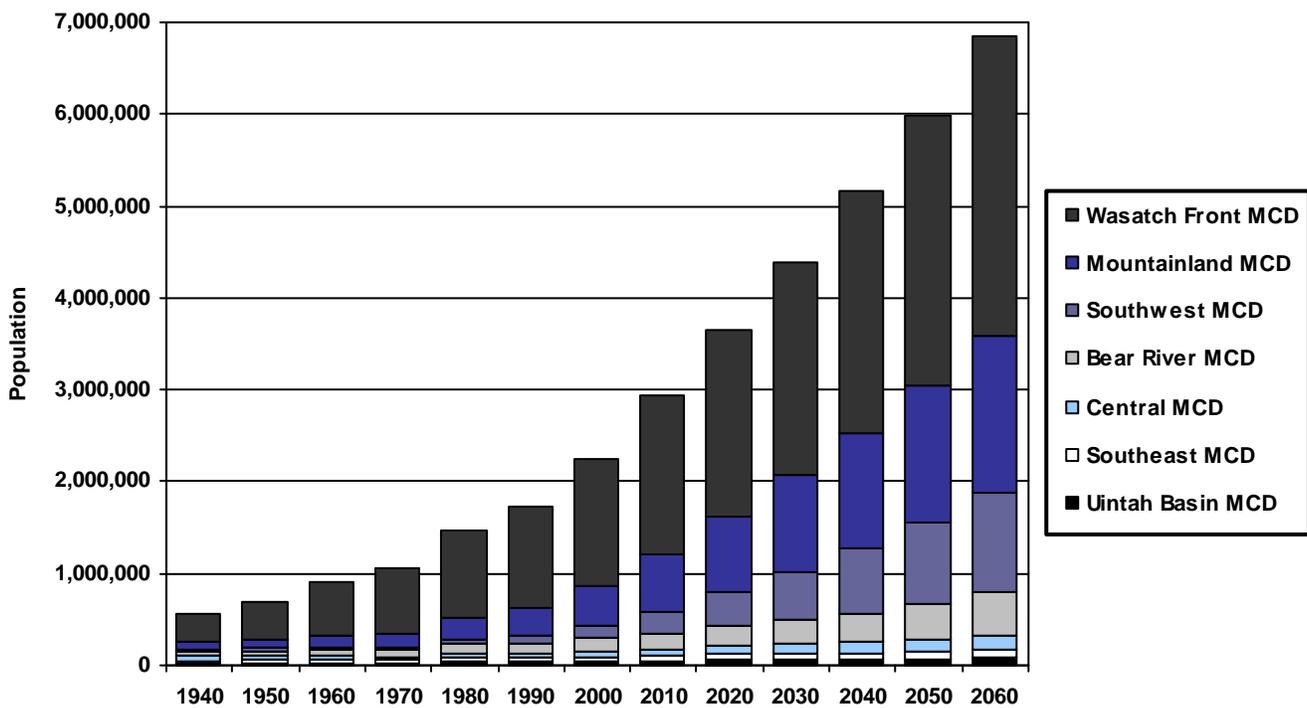

Assumptions

Fertility. State level birth probabilities by age of mother are assumed to remain constant at their estimated 2004 levels to 2060. The resulting total fertility rate (central birth rate) is 2.5 for the state.

Survival. State-level survival rates by age and sex are assumed for the state. Survival rates are assumed to increase along with projected U.S. survival rates to 2060. This assumption yields an increase in life expectancy of 8.2 years, from 78.7 years in 2000 to 86.9 years in 2060.

Employment Growth Assumptions. The underlying assumption in the production of employment projections is that county shares of U.S. employment will trend at historic rates. Therefore, the process of creating long-term employment projections involved extrapolating employment by industry based on a trend analysis of that county's share of national employment. For instance, if a county in Utah constituted 1% of national industry employment in 1980, 2% in 1990, and 3% in 2000, that county would be projected to constitute 4% in 2010, 5% in 2020, and 6% in 2030. This procedure was performed for all counties in Utah.

Notes:

1. Location Quotients are measures of relative shares. The share of a given industry in the subject area (Utah) is compared to that of the reference region (United States). A location quotient greater than one indicates specialization in a subject region relative to the reference region.
2. The Hachman Index measures how closely the employment distribution of the subject region (Utah) resembles that of the reference region (United States). As the value of the index approaches one, this means that the subject region's employment distribution among industries is more similar to that of the reference region.
3. The 2000 number is not available in a NAICS consistent format.

Economic Indicators

Overview

The State of Utah's official July 1, 2009 population was an estimated 2,800,089, an increase of 1.5% over 2008, according to the Utah Population Estimates Committee (UPEC). This is lower than the record growth of 3.2% experienced in 2007. A total of 42,310 people were added to Utah's population, with 3.7% of this increase coming from people moving into the state. Utah's unique characteristics of a high fertility rate and low mortality rate consistently contribute to strong natural increase, the difference between births and deaths. In 2009, the number of births did not surpass the record of 55,357 set in 2008. However the 54,548 births led to a strong natural increase of 40,763. Deaths within the state totaled 13,785 in 2009. Natural increase accounted for 96.3% of total population growth.

The Census Bureau produces population estimates which differ from the UPEC estimates, due to different estimation methodologies. UPEC estimates are revised following the release of the decennial census counts. According to the U.S. Census Bureau's July 1, 2009 population estimate, Utah's population increased to 2,784,572. Utah ranked second among states in population growth with a rate of 2.1% from 2008 to 2009. Utah continues to have a distinctive demographic profile. The state's population is younger, women tend to have more children, people on average live in larger households, and people tend to survive to older ages.

2009 State and County Population Estimates

According to UPEC, the state's population reached 2,800,089 in 2009, a year-over increase of 42,310 persons, or 1.5%. The state experienced its 19th consecutive year of net in-migration in 2009.

Utah's counties experienced varying growth rates in 2009. Differing from recent years, the most rapid growth rates occurred in counties along the Wasatch Back and in the Uintah Basin area of the state, as well as in counties adjacent to larger population centers. Counties that grew faster than the state rate of 1.5% over the past year were Duchesne County, with the highest growth rate of 3.6%, followed by Morgan (3.1%), San Juan (2.9%), Uintah (2.8%), Wasatch (2.6%), Sanpete (2.5%), Daggett (2.5%), Utah (2.3%), Emery (2.2%), Rich (2.2%), Piute (2.2%), Cache (2.2%), Wayne (2.1%), Garfield (2.1%), Davis (1.9%), Grand (1.8%), and Tooele (1.6%) counties.

Four counties experienced an increase in population of less than 1.0% from 2008 to 2009, including one county with population loss. These counties are located in the central and southwest areas of the state. They are Beaver (0.8%), Sevier (0.7%), Washington (0.5%), and Carbon (-0.4%) counties.

Components of Population Change

The total population in Utah increased by 42,310 people from 2008 to 2009. Annual changes in population are comprised

of two components: natural increase and net migration. In 2009, Utah had 54,548 births, below the record number in 2008 of 55,357. Deaths in 2009 set a record totaling 13,785. The resulting natural increase of 40,763 persons marks the third time natural increase in Utah has exceeded 40,000. Natural increase accounted for 96.3% of Utah's population growth in 2009. This is an increase from the previous year's share of 71.4% and higher than the ten-year average of 64.6%.

Net migration is the other component of population change. For a given period, net migration is in-migration minus out-migration, or the number of people moving into the state minus the number of people moving out. Net in-migration in 2009 was 1,547 people, or 3.7% of the total population increase. This marked the 19th consecutive year with net in-migration.

Annual fluctuations in natural increase may result from changes in the size, age structure, and vital rates (fertility and mortality) of the population. The total fertility rate represents the average number of children expected to be born to a woman during her lifetime. Utah's fertility rate, 2.47 in 2005, continues to be the highest among states nationwide.

The National Center for Health Statistics reports that life expectancy increased for both men and women in Utah and the U.S. from 1990 through 2000. Utah's life expectancy has been consistently higher than the national average. Life expectancy in Utah rose from 77.7 years in 1990 to 78.6 years in 2000. Nationally, life expectancy rose from 75.4 years in 1990 to 77.0 years in 2000.

Utah's Young Population

Utah's population growth rate continues to exceed that of the nation. In comparison to other states, Utah's population is younger, women tend to have more children, households on average are larger, and people tend to survive to older ages. All these factors led to an age structure that is unique to Utah.

In 2008, Utah had the highest share of its total population in the preschool age group of any state in the country at 9.8%. Utah also ranks first among states with 21.2% of its population in the school-age group of 5 to 17. Utah had the smallest working-age population in the nation, with 60.0% of Utahns between the ages of 18 and 64. With such a young population, Utah has one of the smallest retirement-age populations, with 9.0% of the total population age 65 and older; only Alaska at 7.3% had a smaller share.

Another way to look at the age structure of a population is to examine the dependency ratio, which is the number of non-working-age persons (younger than 18 and older than 65) per 100 persons of working-age (18 to 64). The U.S. Census Bureau reported that Utah's total dependency ratio for 2008 was 66.8, compared to a national dependency ratio of 59.0.

July 1, 2009 Census Bureau Population Estimates

According to the U.S. Census Bureau, Utah's population reached 2,784,572 in 2009, increasing by 57,229 people, or 2.1% from 2008 to 2009. Wyoming had a growth rate of 2.1% and ranked first, only slightly more than Utah, which ranked second. Texas ranked third with a growth rate of 2.0%, followed by Colorado (1.8%), and the District of Columbia (1.6%).

July 1, 2008 Census Bureau County Population Estimates

Salt Lake County continued to be the largest county in the state with a 2008 population of 1,022,651, followed by Utah (530,837), Davis (295,332), Weber (227,487), and Washington (137,589) counties. Rich County experienced the fastest population growth rate with 5.6% from 2007 to 2008. Rich was followed by Piute (5.1%), Juab (4.3%), Duchesne (4.2%), and San Juan (4.1%) counties. The only county to have population loss in 2008 was Carbon County (-0.3%).

July 1, 2008 Census Bureau City Population Estimates

Salt Lake City was the largest city in the state in 2008, with a population of 181,698, followed by West Valley City (123,447), Provo (118,581), West Jordan (104,447), and Sandy (96,660). Among the state's largest cities, with populations greater than 5,000 persons, West Haven in Weber County was the state's fastest growing municipality. West Haven increased 16.6% from 2007 to 2008, followed by Utah County's Saratoga Springs (13.5%) and Eagle Mountain (12.2%), Weber County's Harrisville (11.0%) and Plain City (9.3%).

State and County Race and Hispanic Origin Counts

In 2008, 98.3% of Utahns were identified as single race by the Census Bureau. Among those that were of a single race, the majority were White (92.9%), followed by Asian (2.0%), American Indian and Alaska Native (1.4%), Black or African American (1.3%), and Native Hawaiian or Other Pacific Islander (0.8%).

The Hispanic population in Utah increased 6.4% from 309,410 in 2007 to 329,069 in 2008. In 1990, Hispanics accounted for 4.9% of the state's population. Utah's Hispanic population as a percent of total continued to increase, from 9.0% of the population in 2000 to 12.0% in 2008. Among Utah's counties, Salt Lake County experienced the highest numerical growth in its Hispanic population (9,754) from 2007 to 2008, followed by Utah (3,376), Weber (1,989), Davis (1,380), and Cache (918) counties. Juab County experienced the highest percentage growth in its Hispanic population (10.9%) from 2007 to 2008, followed by Millard (10.4%), Wasatch (9.9%), Cache (9.7%), and Iron (7.7%) counties. Hispanics made up 16.3% of the total population in Salt Lake

County in 2008, the largest percentage among all counties, followed by Weber (15.9%), Millard (12.6%), Summit (11.7%), and Carbon (11.4%) counties.

Race and Hispanic origin estimates were derived by updating the modified 2000 Census population with data on the components of population change. The enumerated resident population in the 2000 Census is the base for the post-2000 population estimates. The enumerated population was modified in two ways for purposes of developing new estimates: first, the race data were modified to eliminate the "Some Other Race" category; second, the April 1, 2000 population estimates base reflects modifications to the 2000 Census population as documented in the Count Question Resolution program.

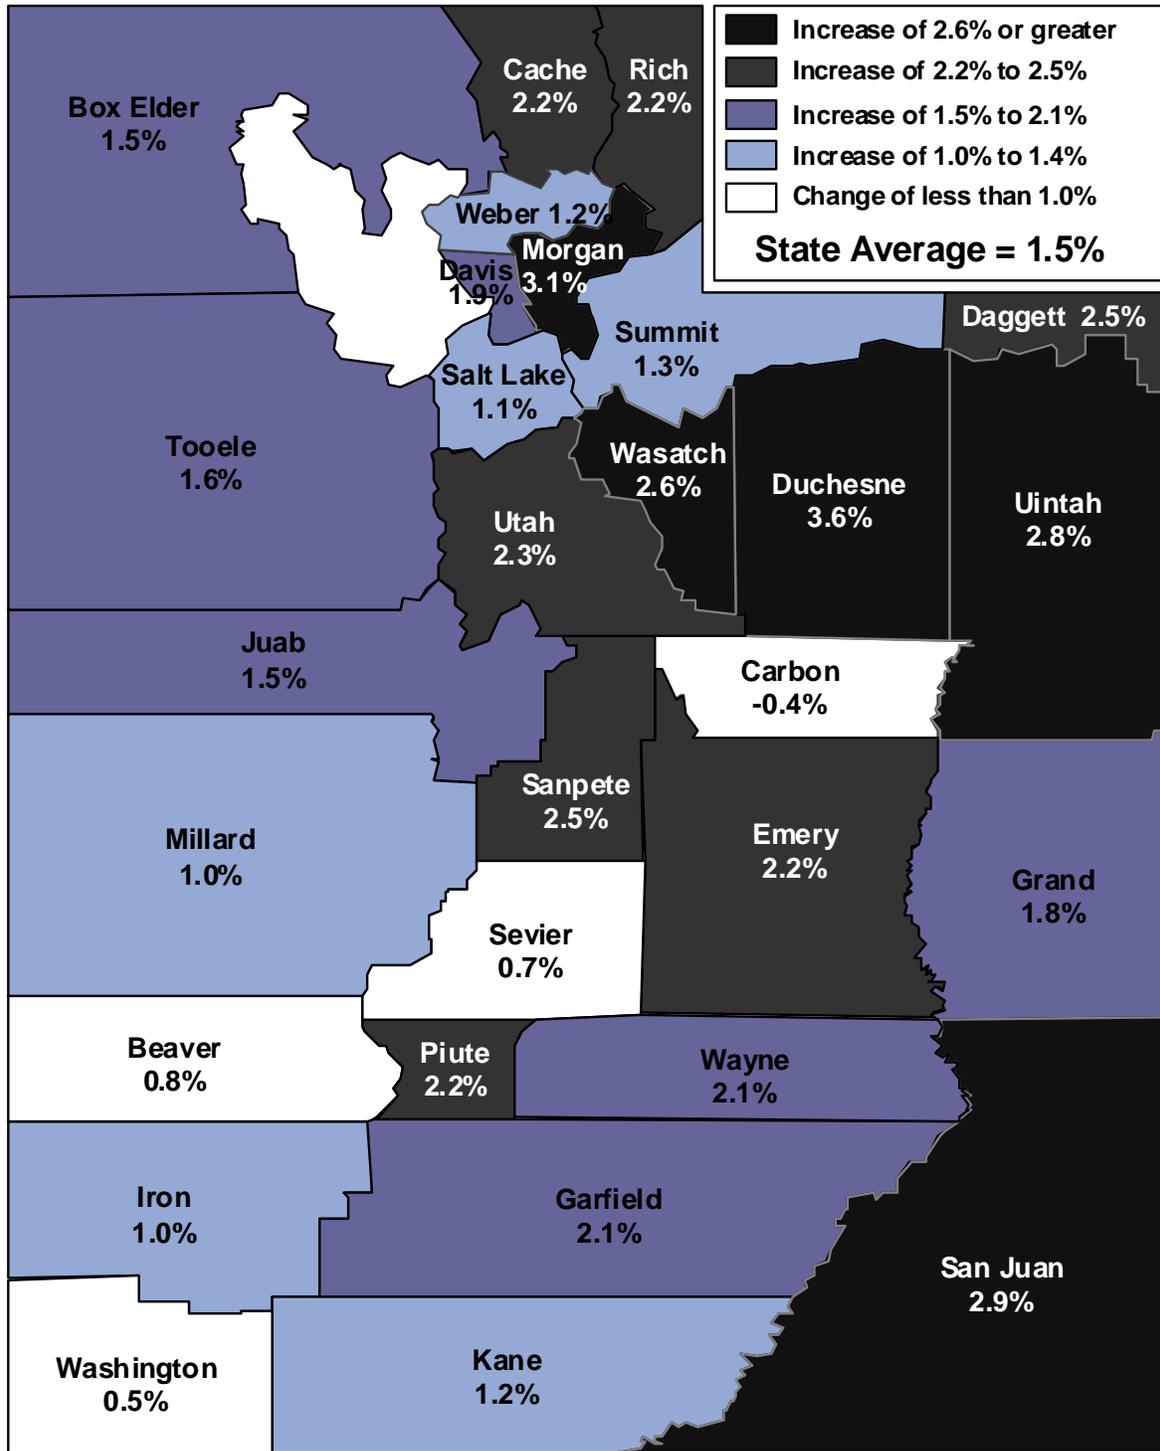

The Office of Management and Budget (OMB) standards identify five minimum race categories: White, Black or African American, American Indian and Alaska Native, Asian, and Native Hawaiian and Other Pacific Islander. Additionally, the OMB recommended that respondents be given the option of selecting two or more races to indicate their racial identity. On the 2000 Census questionnaire, the OMB approved including a sixth category, "Some Other Race", for respondents unable to identify with any of the five race categories. For purposes of estimates production, responses of "Some Other Race" alone were modified by imputing an OMB race alone or in combination with another race response. Responses of both "Some Other Race" and an OMB race were modified by keeping only the OMB race response.

Census Household and Family Characteristics

Utah continued to have the largest household size in the nation, with 3.15 persons per household in 2008, compared to 2.62 nationally. That is a slight increase over Utah's 2007 persons per household of 3.11. The number of households in the state reached 854,244 in 2008, a 2.9% average annual increase since 2000.

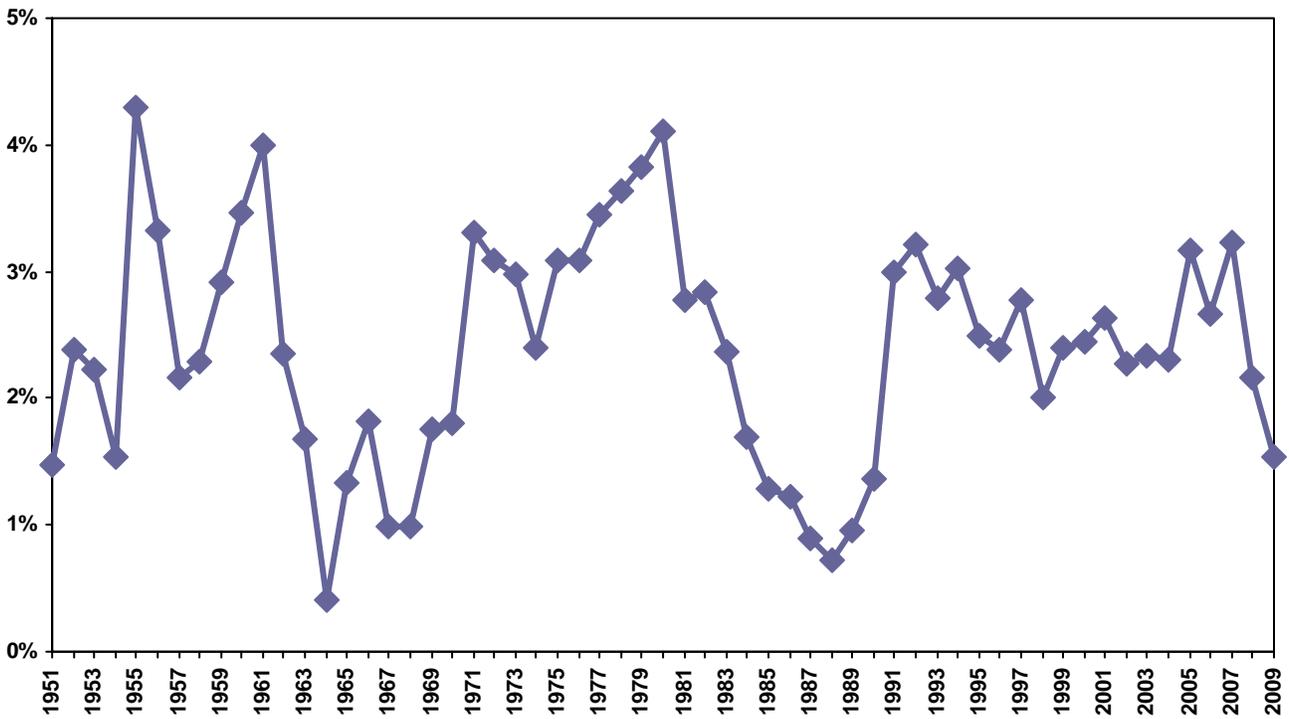

Over the past several decades, the composition of households in Utah has changed significantly. The number of family households has increased by 53.0% since 1990; however, the proportion of households that were designated as family households in 2008 (74.0%) remained very near the 1990 level. An estimated 31.5% of Utah households in 2008 were composed of married couples with their own children under 18, compared to 38.0% in 1990 and 42.0% in 1980. The percent of households that are married couples, with or without children, has declined from 69.0% in 1980, to 65.0% in 1990 and 60.5% in 2008. Despite these trends, in 2008 Utah ranked first in the nation in percent of family households (74.0%) and percent of married couple families (60.5%).

Notes:

1. In 1996, the Utah Population Estimates Committee changed its convention on rounded estimates so that it now publishes unrounded estimates. Accordingly, the revised estimates for 1990 and thereafter are not rounded.
2. The Utah Population Estimates Committee revised the population estimates for the years from 2000 to 2003.
3. A complete history of Utah population estimates can be found at <http://governor.utah.gov/dea>.

Notes:

- Totals may not add due to rounding.
- AARC is the Average Annual Rate of Change.
- The MCDs are multi-county districts and are divided as follows: Bear River MCD: Box Elder, Cache, and Rich counties; Central MCD: Juab, Millard, Piute, Sanpete, Sevier, and Wayne counties; Mountainland MCD: Summit, Utah, and Wasatch counties; Southeastern MCD: Carbon, Emery, Grand, and San Juan counties; Southwestern MCD: Beaver, Garfield, Iron, Kane and Washington counties; Uintah Basin MCD: Daggett, Duchesne, and Uintah counties; Wasatch Front MCD: Davis, Morgan, Salt Lake, Tooele, and Weber Counties.

Note: As a result of the revised standards for collecting data on race and ethnicity issued by the Office of Management and Budget in 1997, the federal government treats Hispanic origin and race as separate and distinct concepts. Thus Hispanics may be of any race. Also, respondents were allowed to select more than one race. Respondents that selected more than one race are included in the "Two or More Races" category. For postcensal population estimates, the "Some Other Race" category was omitted.

Employment, Wages, and Labor Force

Overview

Utah's labor market was negatively impacted by the national recession which began in December 2007. The estimated 2009 job loss of 4.9% was Utah's largest single-year employment contraction in the post-World War II era.

As 2009 drew to a close, there were signs that the nation was beginning to recover from the depth of the recession. U.S. gross domestic product (GDP) began growing in the third quarter 2009, after four consecutive quarters of decline. The nation's GDP is increasing, however employment will be slow to respond because there is a historic delay between a return of production and a return to employment growth.

It is estimated that year-over employment growth in Utah will begin during the first half of 2010 and increase throughout the rest of the year. Nonetheless, early job losses will outweigh later job gains, resulting in a net job loss of 1.8% for the year.

2009 Summary

The current economic recession began in December 2007 and has come in two intensifying phases. The first phase was largely confined to housing and housing-related activities—residential home building, building supplies, mortgage finance, and real estate activities. These areas pulled down the national and Utah economies throughout 2008.

By September 2008, problems in the nation's credit market initiated by the housing collapse affected the stock market, and a broad-based economic collapse followed. The nation was overwhelmed by the speed with which this downturn spread throughout the economy, with rapid and significant job losses spreading across the United States economy throughout late 2008 and the first half of 2009.

Utah's economic downturn reflected that of the nation. Between 2008 and 2009 Utah lost an estimated 61,000 jobs, a contraction of 4.9%. To illustrate, in September 2008, the year-over employment growth was only 0.1%. By June 2009, the year-over decline was 5.4%. During that time Utah's economy lost roughly 67,000 jobs.

Prior to this downturn, the best 12-month period of Utah job growth far outweighed the worst 12-month period of job loss. The largest 12-month period of job loss in Utah was 15,000 jobs lost between March 2001 and March 2002. The best 12-month period of job gain was between June 2005 and June 2006, when 62,500 jobs were added. Between June 2008 and June 2009, 67,000 jobs were lost, more than were created in Utah's best-ever economic performance, underscoring the magnitude of the national economic downturn and its effect on Utah's economy. It is expected it will take several years for Utah to regain the lost jobs.

The recession has affected Utah's labor force participation. Significant job losses will affect how people approach the job market and their prospects for employment. Normally, Utah has about 72% of the 16 years and older population active in the labor force (working or looking for work). Over the past year and a half, the participation rate has fallen to 69%. In other words, about 3%, or roughly 60,000 workers have presently removed themselves from active participation in the Utah labor force. This is a shift from the historical norm, and is a reflection of the magnitude of the economic recession.

Utah's employment decline is primarily due to the overall collapse in the nation's credit markets; and when credit markets are negatively affected, all state economies suffer. There are some Utah-specific economic factors that should also be noted. The areas that experienced a housing-price bubble are the areas most negatively affected by this downturn (measured by employment loss). Not all of the country experienced housing bubbles—most notably large areas throughout the South and Midwest.

Nationwide, the most extreme housing price increases were observed in California, Arizona, Nevada, Florida, and parts of the Northeast corridor. In the west, California, Arizona, and Nevada are currently some of the worst-performing state economies in the nation. Geographic proximity to these states made Utah susceptible to spillover effects.

The St. George area (Washington County) was most affected by the housing bubble in Utah. Its housing market, lying in a sunbelt area, performed more like that of the Las Vegas and Arizona markets than the Wasatch Front market. Washington County's employment levels increased by 25% between 2004 and 2007 with much of the growth in construction (up 47%), driven by the sunbelt housing boom. That market has since collapsed. As of June 2009, Washington County's employment levels had fallen 11.1% over the past two years (with construction down 54%).

Economic Downturn

Most industrial sectors in Utah experienced employment contractions in 2009, with the exception of healthcare, private education, and government. Until the current downturn, Utah had not experienced this magnitude of broad-based job losses in the post-World War II era.

Construction continues to be Utah's deepest area of job loss, with approximately 20,500 fewer jobs than measured in 2008, and with the second consecutive year of job loss for this industry in 2009. Construction jobs are down 33,500 since the end of 2007. The recessionary downturn started with construction and is expected to continue in this industry. Utah residential construction job losses are expected to have leveled in 2009, but it is expected that nonresidential construction job losses will persist at least into 2010.

Utah's manufacturing industry also posted two-year employment losses. The losses for 2009 removed almost 13,000 jobs, making the cumulative loss 14,700 since the end of 2007. Manufacturing showed some negative impact in 2008, but the majority of job losses have occurred in 2009. More job losses for this industry are expected in 2010, but with the end of the national recession in late 2009, job growth could return to this industry in 2011. Utah's manufacturing sector experienced growth between 2003 and 2007, contrary to the national trend. There appear to be unique factors in Utah that cause this industry to grow. If these factors re-emerge after the recession's end, then Utah should expect growth in this industry despite national losses.

The professional and business services industry also experienced sizeable employment losses. With a loss totaling 13,500 in 2009, it is the industry with the second highest job loss. Job losses are partly due to the decline of temporary jobs as temporary workers are easier to shed. Telemarketing jobs also declined throughout the year. High-level, high-paying professional jobs were also under strain, but job losses are not nearly as pervasive in business services.

Government and healthcare and education services were the only sectors that posted job gains in Utah in 2009. Healthcare and education services (private education) employment, on which local demographic factors have greater influence than national economic forces, increased by an estimated 6,000 jobs, most of which were in healthcare. Combined government employment expanded by an estimated 2,800 jobs in 2009. Funding provided through the American Recovery and Reinvestment Act of 2009 had a strong influence on federal government employment, which expanded across-the-board, after contracting across several previous years. Local government posted slight increases, primarily in public education. State government employment fell in response to falling state government revenues.

Significant Issues

The National Economy. The national economy adversely affected Utah, pushing it into the current recession. Some of Utah's unique demographic and economic characteristics will help the State recover faster and stronger than the rest of the nation.

In late 2009, the national economy appeared to improve. Third quarter GDP grew for the first time in a year. The need for businesses to replenish inventories, and the injection

of federal stimulus dollars drove this rebound, but both factors have limits. If consumers and the greater business community are not able to keep the economy moving forward once inventories are replenished and stimulus dollars diminish, the economy could relapse into another economic downturn. Although this is not likely, it is a possibility.

The Stock Market. The stock market is a leading indicator of economic activity. Strong bear markets, like that of 2008 and 2009, generally translate into employment losses. Rebounds do not always mean employment gains. There can be significant delay between emerging from a bear market and employment gains. The dot com recession earlier this decade took nearly three years before the employment picture improved in Utah and the nation. The stock market has rebounded from its March 2009 low.

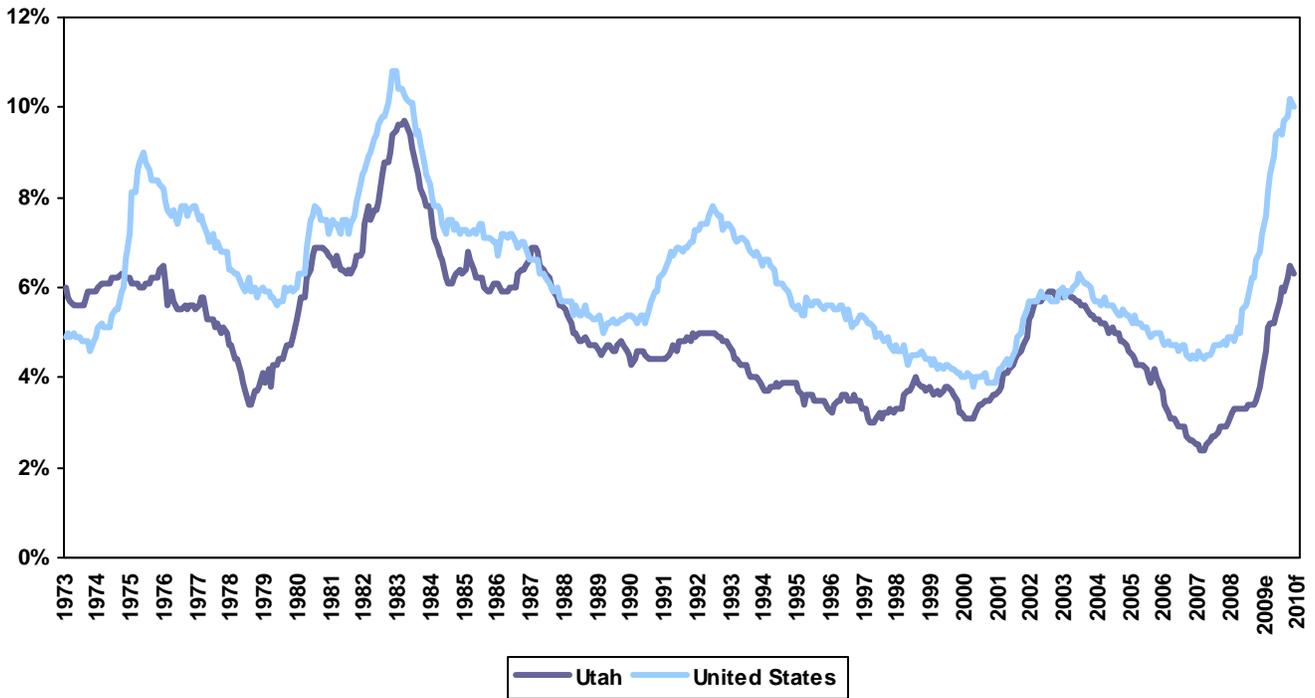

Wage Growth. Utah's 2009 average nonfarm wage grew 0.8% to \$37,800. This is down from wage growth of 2.6% in 2008, and 5.5% in 2007. In 2010 weak economic growth expected in 2010 to lead to average wage growth of 1.5%.

Utah's average nonfarm wage level is typically below the U.S. average. In part, this is a result of Utah's younger population. The largest group of workers in Utah is aged 15-34, whereas in other states, workers aged 45 to 60 dominate the labor force. Older workers, because of experience and tenure, earn higher average wages than their younger counterparts. The United States labor force is much older than Utah's, and this difference in composition is reflected in Utah's lower wages.

2010 Outlook

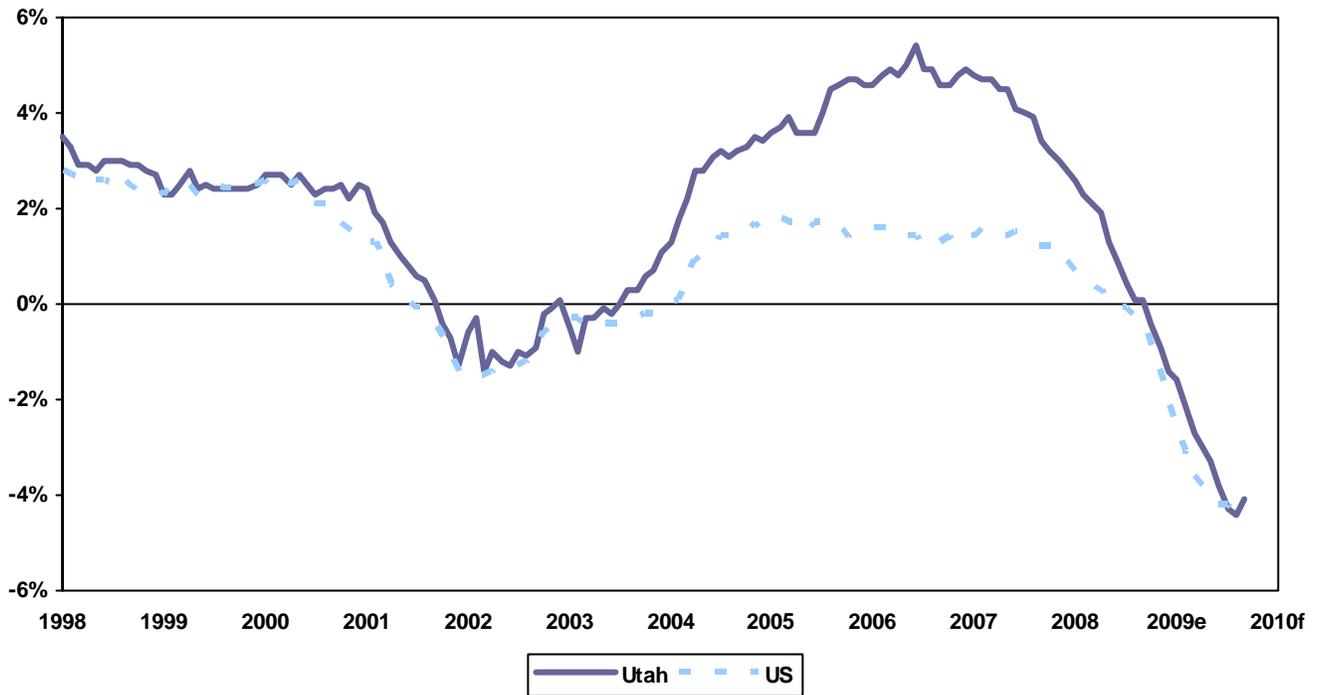

Utah's economy is expected to rebound in 2010. Yet even with modest economic growth, job growth will not offset job losses from 2008 and 2009. The unemployment rate is expected to rise through the first half of 2010. The Utah employment forecast assumes a strengthening national economy throughout 2010. It is possible, however, that the late 2009 national economic expansion will not be sustained, and that a slip back into recession could occur in 2010. If so, then the anticipated Utah employment gains throughout the second half of 2010 will not materialize. By the fourth quarter of 2010, however, the rate of job growth in Utah will accelerate to 1.5%, more than 1% higher than for the nation. As recovery takes hold, and the national expansion begins, Utah's natural advantages as a western hub will drive strong growth for the state.

Overview

Total personal income (TPI) is the sum of all individual personal income in a given region. There are three components of TPI: 1) earnings by place of work; 2) income from dividends, interest and rent (DIR); and, 3) income from transfer payments, such as social security, welfare and pensions. The largest component of TPI is typically earnings by place of work, which consists of the total earnings from farm and nonfarm industries including contributions for social insurance. Per capita income (PCI) is a region's total personal income divided by its total population. Personal income and per capita earnings data are reported quarterly by the U.S. Bureau of Economic Analysis.

2009 Summary

In 2009, Utah's TPI was an estimated \$86.3 billion, a 1.3% decrease from the 2008 estimate of \$87.4 billion. Utah fared somewhat better than the nation, which experienced a decline in TPI of 2.2% in 2009. These declines at both the state and national levels reflect the economic recession that began in December of 2007. The main business cycle indicators (industrial production, real income, employment, and retail sales) all dropped below the average decline of the past six recessions. Early signs indicate the current recession has ended, but it lasted much longer than the 16-month average of previous recessions, and its effects will continue to be felt as unemployment continues to climb and the economy slowly returns to its pre-recession levels. With a young, well-educated population, diversified high-tech industry, growing tourism industry, and business-friendly conditions Utah is expected to recover with the nation.

Utah's estimated 2009 PCI was approximately \$30,758 down 3.9% from the 2008 level of \$31,994. Utah's PCI was only 79.2% of the national PCI in 2009, one of the lowest shares of the past fifteen years. The state's PCI remains weak against the national average as a result of two factors: 1) Utah's average wages are generally below the national average due to the youth of the state's labor force; and, 2) Utah's population is the nation's youngest, its household size is the largest, and, Utah is currently undergoing a baby boom. As a result, Utah's low PCI reflects the relatively larger proportion of non-wage earners in the denominator.

In 2008, Utah's TPI was \$87.4 billion of which \$69.9 billion (about 80%) can be attributed to earnings by place of work. Of this amount, an estimated 58% came from wages, 13.9% came from supplements to wages and salaries, and 8.2% came from proprietors' income. Estimated PCI was \$31,994—well below the national average of \$40,208.

Composition of Total Personal Income. Private sector nonfarm earnings accounted for 81.6% of earnings by place of work, while earnings from public sector made up 18.1%.

Earnings from government employment increased slightly in 2008, and were higher than the national average (16.9%).

In 2008, Utah's income from DIR increased to \$15.3 billion and income from transfer payments was \$10.1 billion. These two factors distinguish the economic composition of Utah from that of the nation. Utah's income from DIR is slightly lower than the national average (17.5% vs. 18% nationally). But the more significant difference is that Utah transfer payments comprise a much smaller portion of TPI than the national average (11.6% in Utah vs. 15.3% nationally). Thus, Utahns rely more on wage earnings for income than their counterparts nationally, but that gap is narrowing.

In 2008, most wages were earned in the public sector, 18.1% of the total, up slightly from 2007, as compared to 16.9% nationally. It was followed by trade, transportation, and utilities, which produced 17.5% of Utah's wage earnings in 2008. Although this sector employed more workers, the wage levels were considerably lower than those paid in the government sector. Professional and business services provided 14.7% of Utah's wages, a noticeable increase above the 2006 share of 14.0%. Manufacturing's share dropped slightly to 11.5% of Utah's wage earnings and 10.9% nationally.

Per Capita Personal Income. According to the U.S. Bureau of Economic Analysis, Utah's 2008 per capita personal income was \$31,994, ranking Utah 49th among the 50 states and Washington, D.C. During the 1970s, Utah's PCI ranged between 83.0% and 85.7% of the nation's PCI. However, from 1977 to 1989, it dropped 10 percentage points to 75.6%. After increasing slightly, Utah PCI as a percent of national PCI is beginning to decline again, most likely due to the increasing number of young non-wage earners in the state, as opposed to the increasing average age nationwide.

Personal and Per Capita Income by County. For most counties in Utah, personal income grew in 2008. Duchesne and Uintah counties—both heavily tied to the energy industry—showed the largest increases in personal income of 19.6% and 11.6%, respectively, followed by Rich County (9.4%) and Cache County (5.9%). Utah's major metropolitan counties showed little growth over 2007.

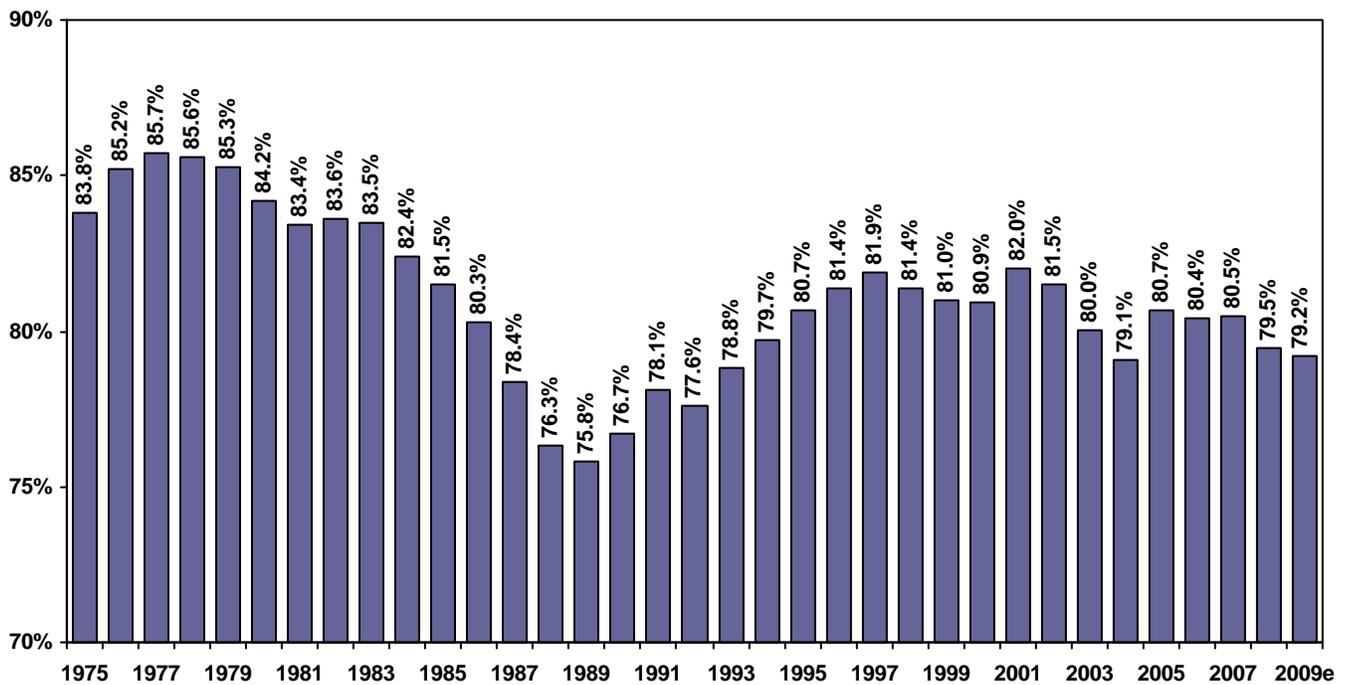

In 2008, Summit County had an estimated per capita income of \$60,233, the highest in the state. It was followed by Duchesne (\$37,886) and Salt Lake (\$36,650) counties. San Juan County (\$16,865) had the lowest per capita income—only 59.8% of the Utah average. Only Summit County per capita income exceeded the national average (\$40,208).

2010 Outlook

Utah's total personal income is expected to decrease by 1.3% in 2009, a remarkable change from the high rates of the previous four years. The recent decline in personal income was

softened by the American Recovery and Reinvestment Act which stimulated the Utah economy and boosted transfer receipts. Although the recession may be over, weak labor market and tight credit conditions will slow the recovery. Current economic conditions in Utah suggest that personal income growth should improve in 2010.

Gross Domestic Product by State

Overview

Gross domestic product (GDP) by state details the value of final goods and services produced by the labor and property located in a state. It is the state-level counterpart to the national GDP. Conceptually, GDP by state is gross output less intermediate inputs, and as such it measures the economic activity within the state. Real GDP controls for inflation by using “chained” dollars (a weighted average of data in successive pairs of years) which is a more meaningful measure of GDP over time. The Bureau of Economic Analysis (BEA) of the U.S. Department of Commerce releases GDP data annually in June. In 2009, BEA revised state-level GDP measures for 2005 through 2008.

Nominal GDP

Utah's nominal GDP (measured in current dollars) was estimated by BEA to be \$109.8 billion in 2008, up from \$105.6 billion in 2007. This represents a growth rate of 4.0%, a significant decline from 2007, when Utah's robust growth rate of 7.9% was the highest in the nation. Although Utah's growth rate slowed, it remained above the national growth rate of 3.3%. Regionally, the Southwest, Rocky Mountains, Plains and Mideast all experienced nominal growth rates above the national average (5.8%, 5.0%, 4.4% and 3.5%, respectively) while the New England, Far West, Southeast and Great Lakes regions all experienced nominal growth rates below the national average (3.0%, 2.7%, 2.6%, and 2.1%, respectively.)

Real GDP

Utah's real GDP (measured in chained 2000 dollars) increased in 2008 in spite of adverse economic conditions nationwide. The BEA estimated Utah's real GDP was \$87.7 billion in 2008, up from \$86.5 billion in 2007. This represents a growth rate of 1.4% and is significantly less than Utah's vigorous 4.6% real GDP growth in 2007—third highest in the nation. Nonetheless, Utah's growth rate remains above the national average (0.7%). Utah's modest growth in 2008 can be attributed to declines in the construction, trade, transportation and utilities, and financial activities sectors of the economy, but is buoyed by significant growth in the professional and technical sector. Regionally, the Rocky Mountain, Plains, Southwest, Mideast and New England regions all experienced real GDP growth rates higher than the national average (2.2%, 2.0%, 1.7%, 1.3% and 1.0%, respectively) while the Far West, Southeast, and Great Lakes regions showed real GDP growth less than the national average (0.6%, 0.0% and -0.4%, respectively.)

GDP Trends

Real GDP in Utah has increased every year since 1999. From 2003 through 2007, Utah experienced especially high growth in real GDP, culminating in 2007 when Utah was third in the nation in increased growth over the prior year. The economic challenges of 2008 are reflected in Utah's lower real

growth in GDP of 1.4%, double the national average of 0.7%.

Industry Growth

Typically, about 75% of Utah's GDP is attributable to five main industry sectors: financial services, manufacturing, trade and transportation, professional and technical services, and government services. The remaining 25% of real GDP is attributable to education and health services, information services, construction, leisure and hospitality, agriculture, natural resources and mining, and other services. In 2008, Utah's real GDP increased by 1.4% overall. Trade, transportation and utilities showed a decrease of 8.5% over 2007 levels. The construction industry, previously one of the fastest growing segments of the economy, showed negative real growth, or contraction, from 2007 to 2008, declining by 11.6%, the second consecutive annual decrease.

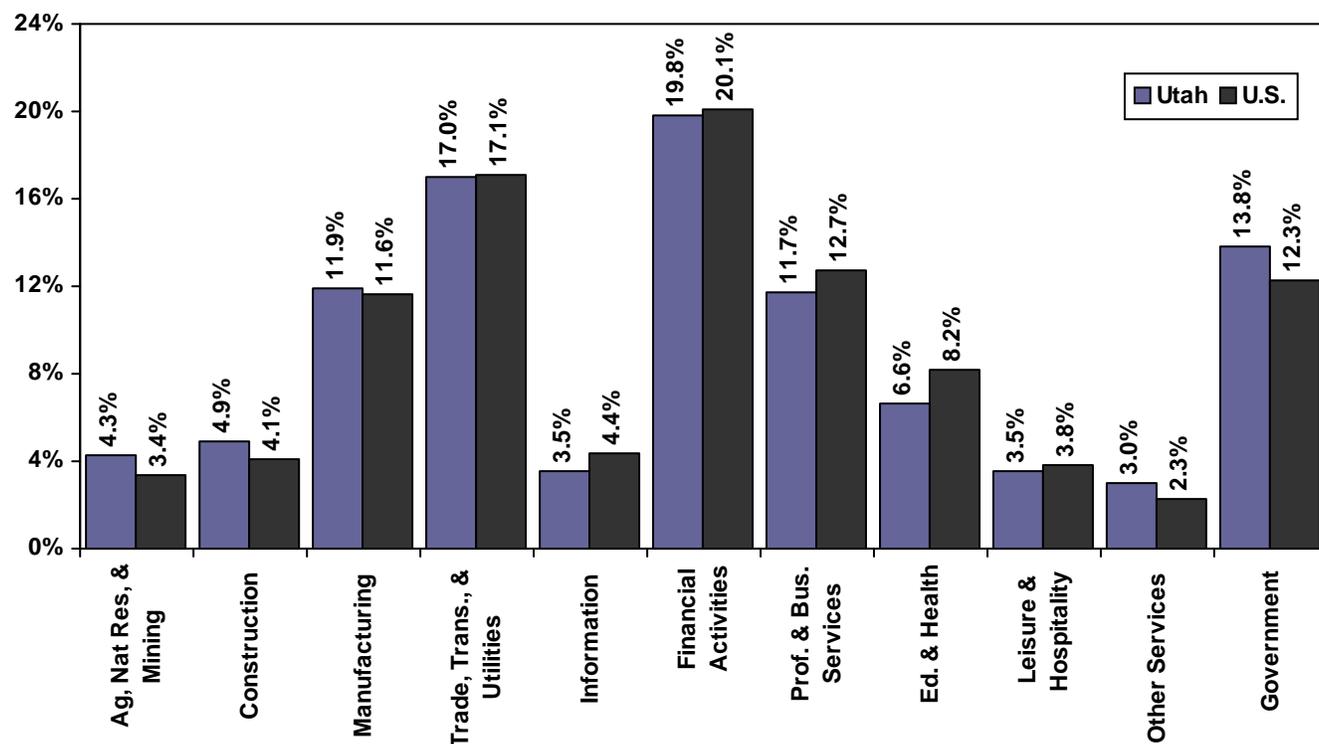

National GDP in 2009

Although this report primarily focuses on GDP through 2008, early estimates of real national GDP in 2009 are encouraging. The BEA reports that, after declines in four consecutive quarters, national GDP increased by 2.2% in the third quarter of 2009, perhaps pointing to signs of economic recovery. The increase primarily reflected positive contributions from personal consumption expenditures, exports, private inventory investment, federal government spending and residential fixed investment. The BEA cautions that these indicators are still estimates and are subject to revision.

Conclusion

After more than a decade of posting strong increases in aggregate production, Utah GDP growth slowed along with the nation in the late 2000s, but Utah's real growth continues to outpace the national average. To the extent that real GDP growth rate in Utah continues to surpass the national GDP growth rate, the improvement in the national economy may be favorably reflected in Utah's economy.

Overview

Taxable sales are comprised of three major components: retail trade, business investments and utility taxable sales, and taxable services. In 2009, total taxable sales in Utah decreased by 8.7% to an estimated \$43.3 billion. This is the second consecutive year of decline in taxable sales.

Retail trade taxable sales were an estimated \$24.3 billion in 2009, representing 56.2% of taxable sales. This is an 8.3% decrease from 2008, the worst contraction on record. Retail trade is projected to grow by 2.2% in 2010. Business investment and utility taxable sales were an estimated \$11.1 billion in 2009, representing 25.6% of taxable sales. This is a decrease of 12.3% over 2008. This sector is expected to fall another 2.7% in 2010. Taxable services were estimated at \$6.8 billion for 2009, representing 15.8% of all taxable sales—a 0.2% increase over 2008. Taxable services are expected to increase by 1.4% in 2010.

2009 Summary

Retail Trade. Taxable sales from retail trade in Utah have shown positive year-over growth for two decades, with an average annual growth of 6.9%, until 2008, when consumers began cutting back on their spending. Reduced spending continued into 2009, as consumers faced a combination of increasing unemployment, declining wealth, and increasing credit restrictions.

Retail Nondurable Goods. Nondurable goods sold by retailers are classified into the following sectors: general merchandise, food, apparel, eating and drinking, and miscellaneous shopping goods stores. Taxable sales from nondurable retail sales reached \$17.4 billion in 2009, which accounts for 40.2% of all taxable sales. In 2009, sales in this sector fell by 2.2% from 2008. The largest category within the nondurable goods retail trade was general merchandise, which includes so-called "big box" stores. This was also the only category among the nondurable goods retailers to register positive growth (7.3%) in 2009.

Retail Durable Goods. Retail durable goods are defined as those items that last three or more years. These goods are broadly associated with building and garden stores, furniture stores, and motor vehicle dealers. The sale and consumption of retail durable goods are usually impacted by job growth, credit market conditions, dealer incentives, and consumer confidence. The decline in both residential and non-residential construction as well as problems in the credit market contributed to depress durable goods sales, which reached an estimated \$6.9 billion in 2009, a 20.7% decrease from 2008.

Business Investment and Utility Sales. Business investment sales and purchases declined for a second year in 2009. This category comprised 25.6% of all taxable sales in 2009.

Approximately 15.8% of all taxable sales occurred in the natural resources and mining, construction, manufacturing, and wholesale trade sectors. The service sectors of transportation, communication, and public utilities comprised 9.8% of taxable sales. In 2009, taxable sales from mining purchases decreased by 10.2% to \$820 million, construction purchases fell 18.9% to \$528 million and taxable manufacturing purchases declined by 21.3% to \$1,931 million.

Taxable Services. The taxable services sector consists of consumer spending on amusement, personal, and financial services, tourist spending for Utah's hotels, resorts, and rental cars, and business and consumer spending on computers and equipment. This sector is driven by growth in wages and population, Salt Lake City International Airport arrivals and departures, and U.S. business spending on software and equipment. After growing 3.1% in 2004, 13.3% in 2005, 10.4% in 2006, 7.9% in 2007 and 11.5% in 2008, taxable services growth flattened to 0.2% in 2009.

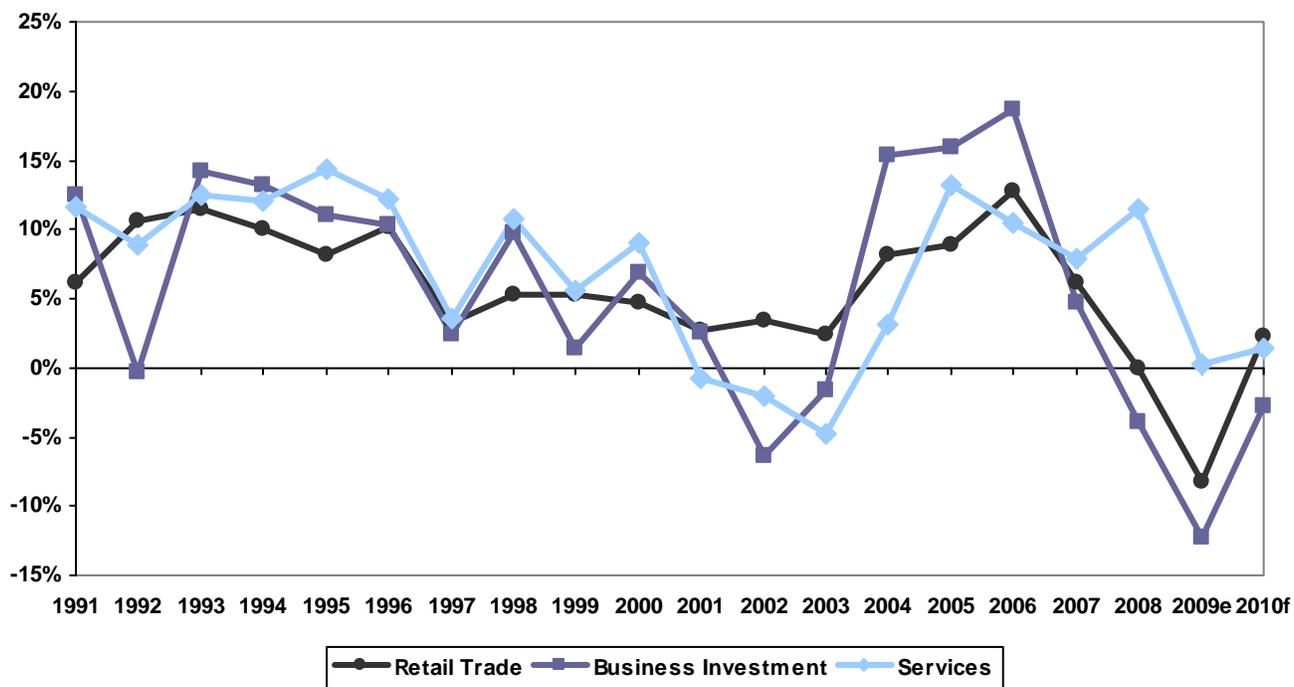

Hotel and lodging sector taxable sales fell by a notable 14.6% in 2009, after growing 27.0% in 2008. Auto rentals and repairs sales increased 15.5% after a very strong increase of 20.5% in 2008. Amusement and recreation increased by 1.6% in 2009 after declining 6.9% in 2008.

The business portion of services experienced mixed results in 2009, falling by 6.1%. Taxable sales for education, legal, and social services increased 49.3%, while financial insurance and real estate services declined 44.3%.

2010 Outlook

Total taxable sales are expected to increase a slight 0.4% to \$43.4 billion, from \$43.3 billion in 2010. The economy is expected to take a slow path to recovery as credit becomes less restricted and consumer confidence continues to grow.

Overview

General and Education Fund (GF/EF) revenue for Fiscal Year 2009 collapsed 12.5% over 2008, reflecting the sudden and severe economic recession. In Fiscal Year 2008, GF/EF revenue declined 1.8% due to a combination of changes in the tax system and a weakening economy. For perspective, during the previous expansion, revenue grew 5.6%, 12.3%, 19.1%, and 9.6%, double and even quintuple the average annual growth rate from 1971 to 2009 of 4.2%.

GF/EF year-end revenue collections for FY2009 were near forecast expectations, with the revenue forecast being off projection by 0.7%. Revenue was expected to fall more than \$683.9 million (13.1%) between FY2008 and FY2009; collections actually fell \$651.5 million (12.5%).

The outlook for tax collections in FY2010 is bleak. The recession is expected to further weaken tax collections, but at slower rates as the economy begins to stabilize. The state is expected to collect \$341.3 million (7.5%) less in FY2010 than it did in FY2009. General Fund collections are expected to decline \$165.9 million (8.6%). Education Fund collections are expected to decline \$175.4 million (6.7%).

Fiscal Year 2010: Reaching Bottom

The Governor's recommended budget (December 2009) showed a decrease in expected GF/EF revenues for FY2010 to \$4,220.1 million. In the 2009 General Legislative Session, FY2010 revenue was expected to fall 3.6% over FY2009, now collections are expected to fall 7.5% in FY2010. Revenues will fall \$341.3 million, the second largest drop on record, but an improvement on the prior year's record drop of nearly double that amount. This expectation is based upon a battered, but stabilizing economy. Extraordinary fiscal and monetary policy measures still support the economy, but have prevented a further slide into what could have been much darker times. The ultimate strength of the recovery in the economy and in tax collections will depend on the timing, speed, and care in which policy is unwound.

Fiscal Year 2009: Recession

The consensus revenue forecast in the 2009 General Legislative Session showed FY2009 revenues down 13.1%. Expected collections of \$4.5 billion for FY2009 were forecast to shrink from the \$5.2 billion received in FY2008—a \$683.9 million decline. This decline was the result of the severe economic recession facing the nation. Collections in FY2009 ended the year down \$651.5 million, a record 12.5% decline.

Fiscal Year 2008: Tax Changes

GF/EF year-end revenue collections for FY2008 fell short of budget estimates by \$81.0 million. Though expectations pointed to flat revenue, a decline of 0.3% for FY2008, collections fell 1.8%. This revenue gap was closed in a September 2008 Special Session utilizing lapsing balances combined with spending cuts, resulting in a balanced budget for FY2008.

Nominal income tax collections grew 1.5% in FY2008 compared with 12.4% growth in FY2007. Though income tax growth was expected to moderate in FY2008, the sharpness with which it fell relative to expectations is largely explained by an overhaul of the individual income tax withholding system that took effect in February 2008. Econometric models confirm that actual growth after adjusting for the systems change would have met expected nominal income tax collection growth of around 5%. These changes will affect FY2009 collections to a lesser degree, but were accounted for in the expected income tax collections.

Internal Revenue Service data by source of taxable income for CY2007 revealed strong growth in capital gains with a 20.1% increase over CY2006. Other sources of income also experienced growth: 11.0% for wages, 28.8% for interest income, 23.9% for dividends, 4.6% for sole proprietors, and 6.6% for partnership income. The growth in capital gains continued to moderate; the CY2005 growth was 55.6% while CY2006 tallied 35.2% growth. Growth of sole proprietor and partnership income fell off significantly from the 30% growth experienced in each of the last two years. Interest income and dividend growth remained strong, reflecting the propensity of most businesses to buy back shares and not hoard cash throughout 2007. While the growth in non-wage income sources continued to moderate, taxable wages grew at the highest rate in the last 25 years, slightly topping 2007's record growth. Overall, the wage component of taxable income remains at historic lows, with non-wage taxable income comprising more than 30% of total income.

Nominal state sales tax collections fell 5.5% in FY2008, reflecting an expected decline in unrestricted sales tax revenue due to aggressive earmarking of state sales tax collections paired with changes to the state sales tax base and rate. Collections were also impacted by slowing net in-migration and reduced housing construction. State investment income earnings fell from \$83.5 million in FY2007 to \$62.8 million (including interest earnings from the rainy day fund transferred in the September Special Session) in FY2008, falling nearly a quarter. Despite declining 2.2% corporate taxes surpassed expectations.

Fiscal Year 2007: Moderating Growth

For FY2007, tax collection growth moderated from the prior year but resulted in growth of 9.1% in GF/EF. The year-end revenue collections exceeded revenue estimates by \$256.6 million, a 34% reduction over the prior year. With rainy day funds at the statutory limit, fewer transfers were made, resulting in a budget surplus of \$241.9 million.

Fiscal Year 2006: Remarkable Growth

For FY2006, GF/EF year-end revenue collections far exceeded revenue estimates by \$390.7 million. The state ended the 2006 budget year with a budget surplus of \$308.4 million after distributions to mandated funds. Inflation-adjusted revenue collections grew an unprecedented 15.3% compared

to FY2005. This rate of growth in combined General Fund and Education Fund revenues was the highest in over 20 years. By comparison, the annual average growth rate in state revenues from 1971 to 2008 averaged only 4.2% (after adjusting for inflation).

Tax Reform and Tax-Cut Legislation

The 2009 General Session produced few changes to tax laws. HB430 and SB14 passed, providing incentives for energy and motion picture production, which were expected to cost just over \$10 million, with the hope of spurring economic activity. SB23 modified the tax treatment of pass-through entities, which was expected to raise nearly \$1 million. Civil filing fees were increased by over \$11 million to mitigate the budget impacts facing the court system.

During the 2008 General Session, several laws were changed relative to tax collections within the state. Tax Changes (HB359S3), an omnibus tax reform bill, modified provisions in the sales tax and income tax. Starting January 1, 2009, the state general sales tax rate was raised from 4.65% to 4.70% and the additional money was diverted to various road projects. The state was authorized to re-enter the Streamlined Sales Tax Compact. The bill also added tax credits for private health insurance purchases, certain capital gains transactions, and solar projects. Railroads no longer pay sales tax on the fuel they purchase. The law also aligned estate and trust taxation with the single rate income tax system, in addition to modifying the treatment of real estate investment trusts (REITs). House Bill 54, Research Activities Tax Credits Amendments, expanded the credit available to business for all research conducted within the state—rather than tying the credit to the additional amount of research conducted over a base year.

An omnibus tax reform bill comprised the bulk of tax changes in the 2007 General Session. Enactment of Senate Bill 223 changed the individual income tax, sales tax, and many business taxes. The dual income tax system was eliminated. Beginning January 1, 2008, Utah maintains a single rate income tax system based on federal adjusted gross income at 5% with an equity credit based upon federal deductions and personal exemptions that phase out as income increases. The state sales tax rate on unprepared food was further reduced from 2.75% to 1.75% and will now be taxed at a uniform statewide rate of 3.0%, while the general sales tax rate was lowered from 4.75% to 4.65%. Businesses benefited from expanded credits for research activity, the reduction of certain gross receipts taxes, and additional sales tax exemptions for business purchases used in the production process.

In the 2006 Fourth Special Session, the Legislature passed SB 4001, Income Tax Amendments, which provided for an optional flat tax rate of 5.35% or, alternatively, expanded brackets and a lower top tax rate for taxpayers who elect to stay with the current system. Under SB 4001, the top rate for the current system dropped from 7.00% to 6.98% and the cur-

rent top bracket moved from \$8,626 to \$11,000, retroactive to January 1, 2006. The 5.35% flat tax rate took effect January 1, 2007. The tax brackets were indexed for inflation starting January 1, 2009.

In the 2006 General Session, the Legislature passed House Bill 109, Sales and Use Tax - Food and Food Ingredients. Effective January 1, 2007, HB 109 removed 2% of the 4.75% state sales tax from unprepared food. Bundled non-food/food items would still be taxed at the 4.75% rate, while applicable local sales tax rates and the Utah Transit Authority sales tax rate did not change.

Several other tax bills were passed in the 2006 General Session: SB 29, Sales and Use Tax Exemption - Telecommunications, provided a sales and use tax exemption relating to certain telecommunications equipment, machinery, or software having at least a one-year life; SB 31, Sales and Use Tax - Manufacturing and Industry Exemptions Amendments, exempted replacement or repair parts with a life of three years or more and exempts electricity or other fuels used to produce energy; and SB 34, Gross Receipts Tax Amendments, Repeal of Public Utility Tariffs, repealed and modified gross receipts taxes and is applied to certain utilities in lieu of the corporate franchise tax.

Finally, House Bill 78, passed by the Legislature in the 2005 General Session, came into effect on January 1, 2006. This measure provided businesses with the option of double weighting the sales factor in the apportionment formula used to compute corporate tax payments. This tax change primarily benefits corporations with significant out-of-state sales.

Earmarking Legislation

During a late 2008 Special Legislative Session, and through the 2009 General Session, \$35 million of sales tax earmarks were restored to boost General Fund sales tax collections, 11% of earmarked funds. These were programmed to expire by Fiscal Year 2010. This diversion resulted in FY2009 sales tax only falling \$191.9 million (11.1%), without which the sales tax general fund would have fallen 13.0%. The remaining 89% of earmarked funds, and the future growth in earmarked funds were bonded against to fund large transportation projects.

As indicated earlier, HB359S3 from the 2008 General Session increased the general sales tax rate 0.05%. The money generated from the additional tax was used to construct highways and mitigate traffic congestion. Combined, the expected cumulative annual earmarks for state transportation projects from the sales tax approached \$275 million.

Additional earmarks to the sales tax were granted during the 2007 General Session. Under HB 383, the one-sixteenth rate sales tax diversion cap of \$18.7 million was removed for Class B and C roads. At implementation, this was expected to cost \$6.0 million. Additionally, HB 314 provides for the ongoing

diversion of \$90.0 million in sales tax revenue to the transportation fund.

Substantial investments in infrastructure were also made in the 2006 General Session. Effective July 1, 2006, HB 112 required that 8.3% of state sales tax collections be deposited into the Centennial Highway Fund Restricted (earmarked) Account. Ongoing, unrestricted sales taxes (General Fund revenues) will consequently be reduced by the same percent. This was a sizable annual earmarking well in excess of \$160 million.

In addition, an extra \$8.6 million in sales tax was earmarked for water development by the Legislature. Effective July 1, 2006, HB 47, Sales Tax Diversion for Water Projects and Water Financing, removed the \$17.5 million cap on the one-sixteenth rate sales tax that can go to water development. Cloud seeding and watershed rehabilitation were added as allowable uses of the earmarked funds.

Income Tax Continues Its Preeminence

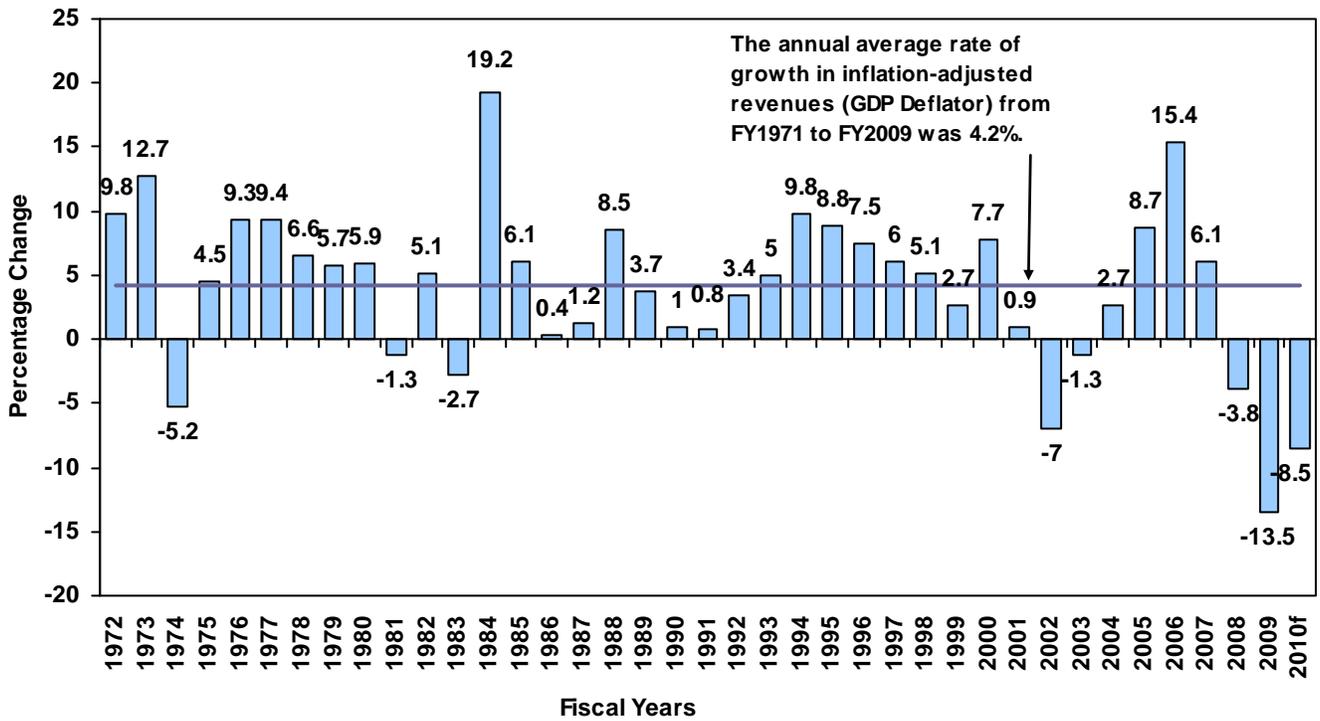

The 2000s became the first decade in which income tax collections exceed sales tax collections. Prior to FY1998, sales taxes made up the largest portion of state government's unrestricted revenues. In FY2009, income tax collections represented 45.2% of total unrestricted revenue collections, whereas sales tax collections were 29.9% of the total. This income tax preeminence is due to several factors. First, the sales tax rate has declined. Second, the state has historically

realized stronger growth in sales tax-exempt services industries than in taxable goods industries. Third, there was an increase in sales tax exemptions. Fourth, sales over the internet have increased. Fifth, failure to index tax brackets led to "income tax bracket creep." Sixth, there was an increase in non-wage income gains. Finally, unrestricted general fund monies were transferred to restricted accounts through the practice of earmarking.

Cumulative Historic Tax Reductions

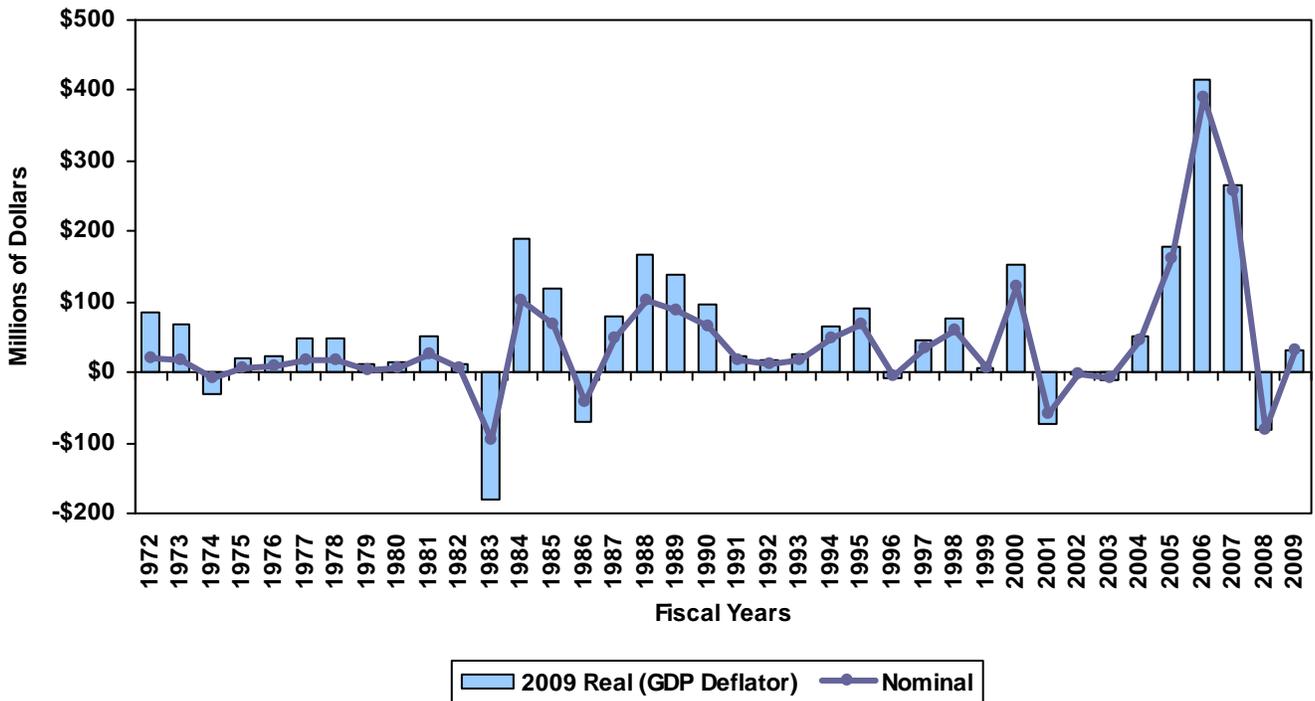

Tax collections in Utah experienced a net reduction of \$382.1 million (on an annualized basis) due to major statutory changes that occurred over the last decade of legislative sessions. From FY2002 to FY2006, net changes to tax collections from policy changes combined for a net increase of \$39.6 million. In contrast, from FY2007 to FY2010, major tax reform resulted in \$423.0 million in tax cuts. The cumulative reduction in taxes authorized in these sessions from FY2002 through FY2011 is \$1,320.1 million. A taxpayer may actually pay more in state taxes now than in previous years, however, taxpayers in the state pay less tax than they otherwise would owe had the tax system not been changed in the last decade. Additionally, a portion of these tax reductions reflect tax shifts from the state to local governments. Finally, the situation of any given individual taxpayer is a function of income received, money spent, and the change in the value of assets, combined with place of residence and the structure of the tax system.

Table 45 (continued)

Rolling 10 Year State Tax and Fee Changes (Over \$500,000) Regular and Special Legislative Sessions (A)(B)(C)

Notes:

(A) This table is not adjusted for tax increases due to income tax "bracket creep".

(B) This table is not adjusted for inflation. Only fiscal notes for state tax and fee increases or decreases greater than or equal to \$500,000 are listed. Changes in local taxes are excluded. Extensions of existing laws are excluded.

(C) This table does NOT include shifts within the total state budget due to earmarking or other diversions.

(1) Increases income tax deduction for amounts paid for health care insurance from 60% to 100% of amounts not deducted from federal taxes.

(2) Changes in the reserve rate and calculation method will produce a tax reduction for all employers paying this insurance at the contributory rate. Taxes (income to the Employment Compensation Fund) will be reduced by \$26,500,000 per year beginning in fiscal year 2001. The reserve fund was reduced from 22 to 18 months.

(3) The hospital assessment tax was repealed in fiscal year 2001. This was a tax rate on hospital gross revenues, as well as \$0.9 for each surgery performed. The tax rate was adjusted quarterly so that no more than \$5.5 million annually was collected.

(4) Exempts an individual from paying income taxes if federal AGI is less than the sum of the individual's personal exemptions plus his/her standard deduction (removes about 30,000 low income individuals from state income tax rolls).

(5) The top bracket was increased from \$7,500 to \$8,626 and the bottom bracket was increased from \$1,500 to \$1,726 (15,000 taxpayers were dropped out of the highest bracket).

(6) Repeals the \$1.83 per patient day nursing home "bed" tax (the hospital bed tax was repealed in the 2000 General Session).

(7) Established fees and taxes that apply to the reprocessing, treatment, or disposal of certain types of radioactive waste.

(8) Increased tax on cigarettes 18 cents per 20 pack, from 51.5 cents to 69.5 cents.

(9) Increased tax on 31-gallon barrel of beer from \$11 to \$12.80 and created the Alcoholic Beverage Enforcement and Treatment Restricted Account.

(10) Increased the environmental assurance fee of 1/4 cent per gallon on the first sale or use of petroleum products to 1/2 cent per gallon. The fee will be reduced when the cash balance in the restricted Petroleum Storage Tank Trust Fund exceeds \$20,000,000 in any year.

(11) Increased some fees and the mark-up on liquor from 61% to 64.5%.

(12) Imposed sales and use tax on cable and satellite TV service.

(13) Increased regulatory fees and taxes on radioactive and hazardous waste received at waste facility for treatment or disposal.

(14) Increased court filing fees to fund creation of Court Security Account which will be used to contract for security at courts across the state. Money is deposited into a restricted account.

(15) Restricted revenues for commerce (professional licensing), courts, natural resources, agriculture and other general user fees.

(16) This bill establishes an assessment on nursing care facilities in order to gain federal matching funds to enhance the total funding for these facilities. The bill authorizes the assessment to be up to 6% of each nursing care facility's total gross revenue.

(17) Imposes a state excise tax of 6.25% on amounts paid or charged for cable and satellite TV service.

(18) Reduces the tipping fee from \$28 to \$14 per ton and eliminates the 3% gross receipts tax (created in 2003 General Session by HB 286s1) for nonhazardous and low radioactive waste.

(19) Imposes a 10% tax on nude dancing and escort services.

(20) Levies an equity assessment of 1.75 cents per cigarette on nonparticipating tobacco product manufacturers.

(21) Eliminates unintended sales tax increases by exempting delivery, installation and 'direct mailing' charges as well as rebates on new motor vehicles.

(22) This bill amends the Sales and Use Tax Act to provide a sales and use tax exemption relating to certain telecommunications equipment, machinery, or software having at least a 1 year life.

(23) This bill repeals and modifies gross receipts taxes and requires Rocky Mountain Power (RMP) to file new tariffs with the PSC. Reverses a tax imposed to raise revenue last year. This tax is applied in lieu of a corporate profits tax. RMP will lower rates for consumers in exchange for the tax cut.

(24) Exempts replacement or repair parts with a life of 3 years or more. Adds scrap recyclers to the exemption. Electricity or other fuels used by these plants to produce energy is exempt from taxation.

(25) Allows the option of choosing double weighting of the sales factor for tax years beginning January 1, 2006. This will start to have an impact on FY07 collections. The double weighted sales factor will help companies with sales outside of Utah.

(26) Removes 2% of the 4.75% sales tax on unprepared food effective January 1, 2007. Allows for a 1.31% vendor discount. Nonfood/food items that are bundled are taxed at 4.75%. UTA and local taxes are unaffected.

(27) Provides for an optional flat rate of 5.35%; or the taxpayer can stay with the current system with expanded brackets and a lower tax rate of 6.98%. Top rate drops from 7.00% to 6.98% and the top bracket goes from \$8,626 to \$11,000 as of January 1, 2006. The 5.35% flat rate takes effect January 1, 2007. Indexing for inflation starts January 1, 2009 at around \$4 million to \$6 million per year.

(28) Provides a single rate individual income tax system at 5% of Adjusted Gross Income, with a credit at 6% of the federal deduction that phases out at 1.3 cents on the dollar beginning at \$12,000 Single, \$18,000 Head of Household, \$24,000 Married Filing Joint. The state general sales tax rate was reduced from 4.75% to 4.65%, the state rate on unprepared food items moved from 2.75% to 1.75%. The bill also expanded credits for research and development, modified gross receipts taxes, extended the renewable energy tax credit, granted sales tax exemptions for certain purchases in the mining industry, reduced the Multi-Channel Video or Audio tax, and modified a host of other local tax issues.

(29) Provides for a 0.05% rate increase to the state general sales tax rate earmarked for road construction, provides income tax credits for users of medical care savings accounts, capital gains transactions, private health insurance purchasers, and certain solar projects. Brings estate/trust income taxation in line with the single rate system. Exempts railroad purchases from the sales tax on fuels. Addresses income taxation of real estate investment trusts (REITs).

Overview

Worsening economic conditions in Utah, the nation, and around the globe were reflected in Utah's production and export levels through 2008 and 2009. Utah's total exports fell from \$10.3 billion in 2008 to an estimated \$9.3 billion in 2009, a decrease of 10.1%. Exports have been above \$4.0 billion since 2002 and above \$6.0 billion since 2005. Record high levels in 2008 were primarily due to robust export growth in the first quarter, dropping sharply as housing and financial market declines translated into weak demand for manufactured goods to foreign markets.

Utah exports fall into one of two categories: primary metals and everything else. Shipments of primary metals, particularly gold, accounted for approximately 43.9% of total exports during 2009. Computers and electronics comprised the second highest proportion of total exports, 14.7%. In 2009, exports declined in 24 of 35 major destinations for Utah merchandise—a sharp contrast to 2008, when exports declined in only eight countries and overall exports were up almost 38% over the prior year.

Exports had greater declines in other states than in Utah. Nationwide, 2009 export levels fell to \$957 billion from \$1.2 trillion in 2008, a decline of more than 19%. As the economy begins to recover, exports should rebound to their pre-recession levels.

2009 Summary

Utah's Merchandise Exports in National Context. Notwithstanding Utah's 10.1% decline in exports, the state ranked fifth highest in export "growth". That is, with the exception of Nevada, all states reported decreased exports from 2008 levels. New Mexico ranked last, showing a 53% decline in exports in 2009. Nevada ranked highest, showing no change in export growth. As a nation, exports in 2009 declined 19.1% from 2008.

In terms of total exports in 2009, Utah ranked 27th, exporting about \$9.3 billion, or 1.0% of total national exports. Texas continued to lead the nation in exports with \$154.3 billion, a decline of 19.7% from 2008. Texas exported 16.1% of the nation's total exports. Texas was followed by California (\$116.6 billion, 12.2% of total), New York (\$55.5 billion, 5.8%), Washington (\$48.8 billion, 5.1%) and Florida (\$44.5 billion, 4.6%). These five states accounted for 43.8% of the nation's total exports.

Utah's Merchandise Exports by Industry. Utah's leading merchandise export in 2009 was primary metal products, almost exclusively gold. Primary metals exports decreased by 4.1% in 2009 to \$4.1 billion. Primary metals constituted 43.9% of Utah exports in 2009, an increase from 2008 when they accounted for 41.5% of total exports. Exports of computers and electronics were the second largest category of

exports in 2009, accounting for 14.7% of total exports. Other leading export categories for 2009 were chemicals (\$611.1 million, or 6.6% of total) transportation equipment (\$596.3 million, 6.4% of total), minerals (\$515.2 million, 5.6% of total), and food (\$472.2 million, 5.1% of total).

In 2009, substantial growth was seen in the following categories: Chemicals, up 23.1% to \$611.1 million; Fabricated Metals, up 109% to \$350 million; Plastics, up 15.4% to \$111.4 million; Beverages, up 126% to \$63.5 million; Milled Textiles, up 102% to \$32 million; and Livestock, up 604% to \$6.1 million.

Notable declines were seen in: Primary Metals, down 4.1% to \$4.1 billion; Computers and Electronics, down 31.5% to \$1.4 billion; Transportation Equipment, down 26.6% to \$596 million; Minerals, down 10.8% to \$515 million; and Food, down 7.9% to \$472 million.

Destination of Utah's Merchandise Exports. Utah's largest regional markets for merchandise exports are typically Western Europe, East Asia, and Canada. In 2009, these three regions accounted for 83.7% of all exports from Utah. West Asian countries saw the largest year-over increase in exports at 16.7%, reaching \$854 million.

During 2009, the United Kingdom was Utah's largest customer with exports totaling \$4.2 billion in goods. Canada was the second largest customer of Utah products with \$904.2 million in exports. India was third (\$718.7 million), followed by Taiwan (\$512.0 million) and China (\$473.2 million). Exports to India increased 44.7%, moving India to the third largest consumer of Utah products from its sixth-place position in 2008. In 2009, the top five purchasing countries accounted for 71.7% of all Utah exports. The top ten accounted for 85.0%, or \$8.1 billion in goods.

Canada and Mexico. The two countries in closest proximity, Canada and Mexico, were Utah's second and seventh highest export destinations, respectively. In contrast to the United Kingdom, where the vast majority of Utah exports were in the form of gold, Canada and Mexico imported a wider array of goods. In 2009, the largest categories of goods exported to Canada were transportation equipment (\$167.8 million), chemicals (\$133.8 million), and machinery (\$83.8 million). The largest categories of goods exported to Mexico were chemicals (\$44.9 million), food (\$39.0 million), and minerals (\$38.5 million). From 2007 to 2008, total exports to Canada increased 10.2% and total exports to Mexico increased 2.3%. From 2008 to 2009, total exports to Canada fell 16.5%, but increased 4.1% to Mexico.

Gold. Utah continues to be a large exporter of gold, however, the amount of gold the Census Bureau reports as being exported from Utah is dramatically larger than what is mined in Utah. Conversations with industry contacts suggest essen-

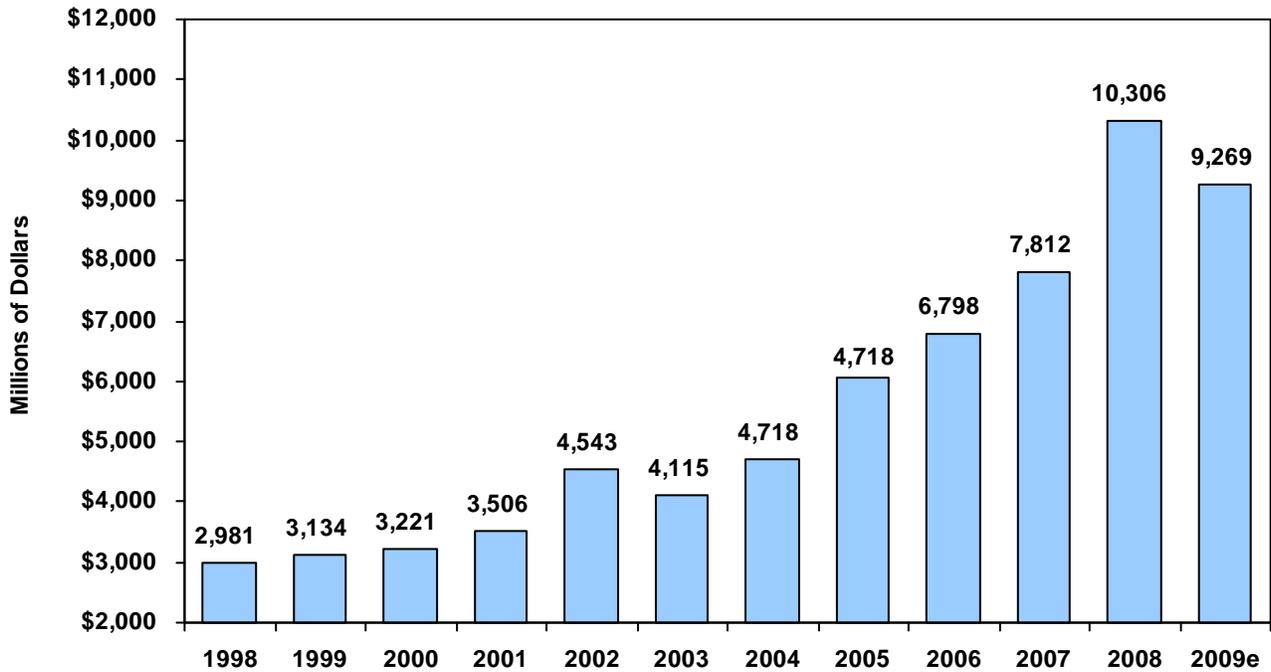

tially all of the gold mined in Utah remains within the U.S. and is not included in exports. The gold exported from Utah is primarily mined in other western states. Partially refined ore is shipped into Utah for final processing into pure gold, and then shipped to customers mostly in the United Kingdom and, more recently, India. Switzerland has historically been a major destination of gold shipments, but in 2008 gold exports decreased significantly and remained low in 2009. Shipments of gold constituted 43.9% of Utah's exports in 2009, an increase from 2008 when gold exports totaled 41.5% of exports. Gold exports constituted 97% of all export dollars to both the United Kingdom and India.

Gold exports do not provide a substantial number of jobs for the state and inflate the amount of goods Utah exports. For this reason, it is important to consider excluding gold from total exports. Without gold, exports fell to \$5.2 billion from \$6.1 billion, for a decline of 14.5%.

2010 Outlook

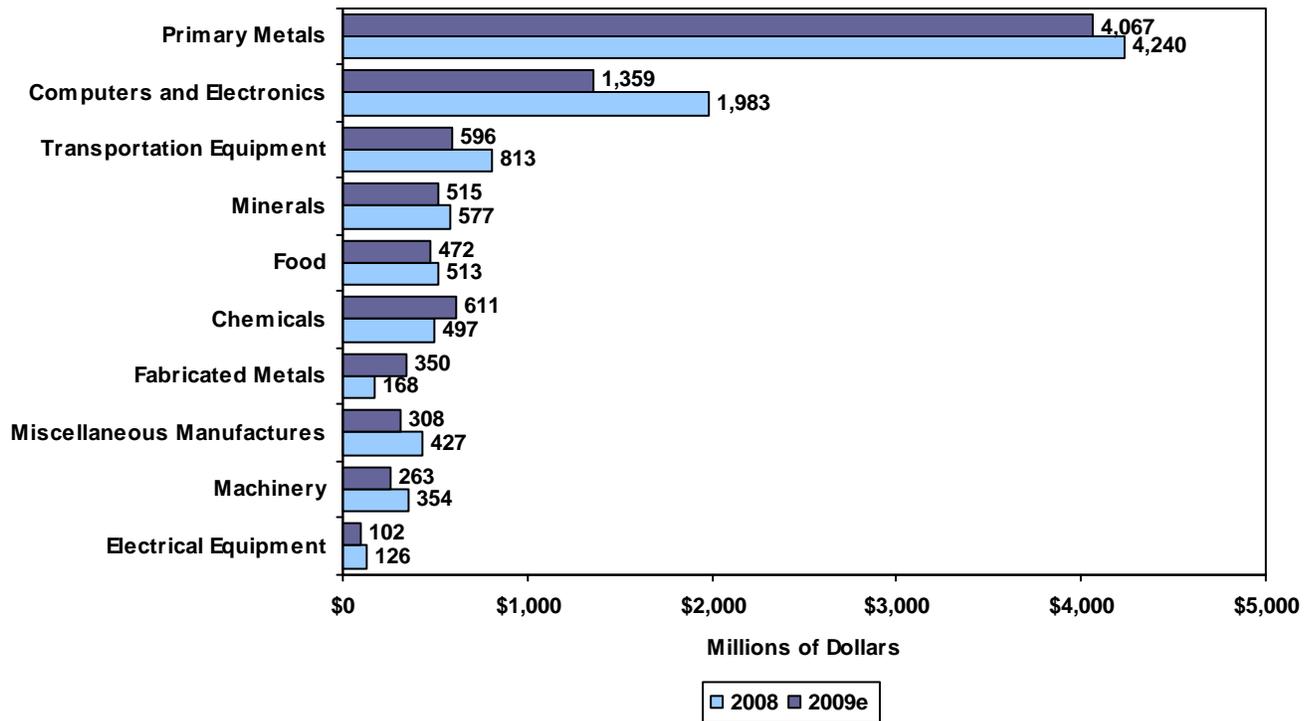

Utah's exports decreased 10.1%, from \$10.3 billion in 2008 to an estimated \$9.3 billion in 2009, mainly due to the economic downturn of 2008-2009. With the modest increase in national GDP in the third quarter of 2009 and expectations of an improved economy in the balance of 2009 and into 2010, export levels should rebound accordingly and exceed their pre-recession level of \$10 billion.

Price Inflation and Cost of Living

Overview

In 2009, aggregate prices as measured by the Consumer Price Index (CPI), decreased from their 2008 levels by an annual average of 0.3%, compared to an increase of 3.8% in 2008. The gross domestic product (GDP) chain-type price deflator increased an estimated 1.2% in 2009, down from 2.1% in 2008. Inflation is not expected to be an issue in the short term due to a lack of aggregate demand and surplus aggregate supply. Given the unprecedented government response to the economic recession through stimulus spending, money supply increases, short-term rate reductions, and long-term rate management, professionals are concerned about longer-term inflation prospects once aggregate demand and aggregate supply show signs of strength.

2009 Summary

Consumer Price Index. The CPI measures price changes for a fixed basket of goods and services. The CPI for Urban Consumers (CPI-U) decreased by 0.3% in 2009, measured on an annual average basis, compared with an increase of 3.8% in 2008. Inflation is expected to return in 2010, with forecasts projecting the index to increase 1.7%.

Gross Domestic Product Deflator. Instead of measuring a fixed basket of goods, the GDP deflator allows for substitution among goods and services along with changing prices. In 2009, the GDP chain-type implicit price deflator will have increased by about 1.2%, lower than the 2.1% increase in 2008.

Significant Issues

Labor Market. Inflation should remain subdued due to poor performance of the labor market. Average annual employment declined by 61,000 jobs (4.9%) between 2008 and 2009. Current economic indicators project continued labor market problems in 2010, with average annual employment declining 1.8%. For inflation to increase at a reasonable positive rate, wages would need to show signs of strength. This is not projected to be the case until 2011.

Housing. The housing market contributed to overall price deflation of 2009 and is not expected to provide any support to prices through 2011.

Industrial Commodities. Industrial commodities were a large driver of price inflation prior to 2009 and have been a major contributor to price deflation in 2009. These commodities influence virtually all consumer purchases (either directly or indirectly), from gasoline purchases to toys. The current projection is for prices in this area to remain relatively stable in the short term.

Federal Reserve. In anticipation of the expected economic contraction, the Federal Reserve began lowering the short-term Federal Funds target rate in September 2007, three

months before the national recession officially began. This rate reduction pattern continued until it reached a short-term target rate range of 0% to 0.25%, the lowest on record. Such a low rate affects inflation in that it encourages borrowing and spending. The short-term rate effects, though, are currently quite subdued due to business and consumer concerns over macroeconomic conditions. Should the Federal Reserve not act when signs of sustained economic growth materialize, the low short-term rates could induce strong inflation – as was the case with the recent housing price bubble that stemmed partly from low short-term rates.

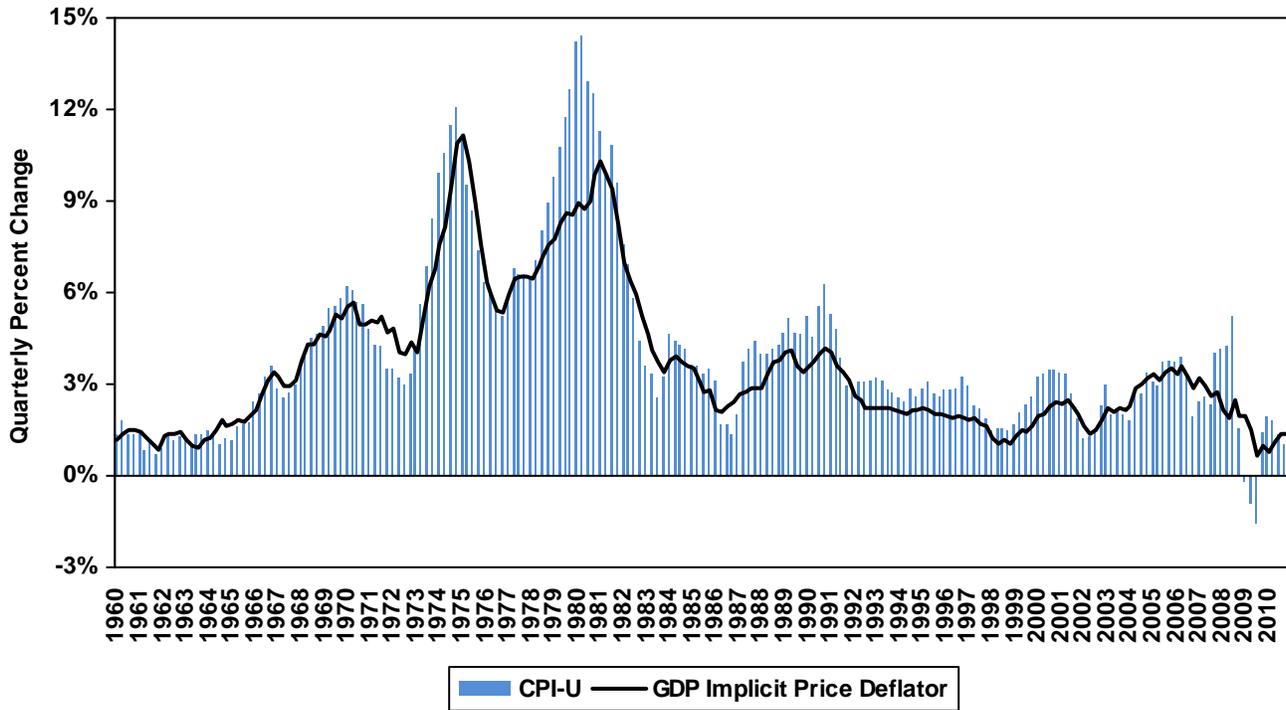

Government Spending. For its fiscal year 2009 (October 1, 2008 to September 30, 2009), the U.S. government's deficit, \$1.4 trillion, was the largest on record, in absolute amount, and the largest as a percent of GDP since the peak of the build-up for World War II during 1944. As the rapid increase in CPI inflation, from 2% in early 1946 to nearly 20% in mid 1947, demonstrates, large deficits can be inflationary. The federal budget is designed to automatically offset the contractionary effects of a recession, stabilizing the economy. As economic activity declines and unemployment increases, tax revenue falls and spending for existing programs such as unemployment insurance, assistance to families, and food stamps increases. Most of the FY2009 deficit results from these so-called "automatic stabilizers," declining revenue and increased program spending. However, almost \$200 billion results from spending and tax cuts related to the American Recovery and Reinvestment Act stimulus, and another \$170 billion results from the Troubled Asset Relief Program to counter the financial crisis. As the economy recovers, the federal government will need to reduce the deficit if the low inflation of the past two decades is to be maintained.

The Dollar. Although a depreciation of the dollar increases the competitiveness of exports in the world markets, it also increases the prices producers and consumers pay for imported goods. During most of 2008, the dollar rose against the currencies of major trading partners. This short period of general appreciation has ended. If the dollar declines as it did for most of this decade, it would put upward pressure on inflation. Such a decline is not expected, but the possibility is a cause for concern.

Conclusion

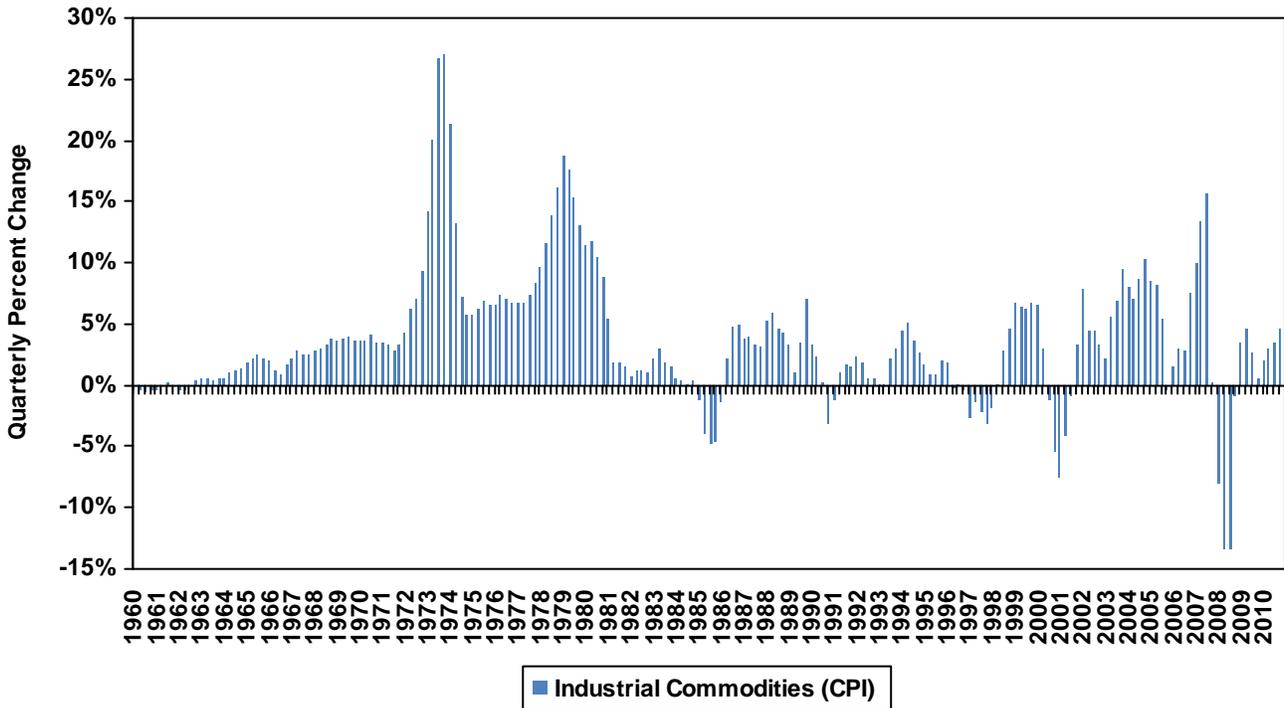

As energy and housing prices climbed, inflation accelerated during the summer of 2008. With the financial crisis, and subsequent economic contraction, the CPI actually declined. The longer term picture is cloudier, with concern that above-trend inflation is a risk to sustained economic growth.

Sources: Bureau of Economic Analysis, estimates by the Governor's Office of Planning and Budget

Overview

The national economy slowed in 2008, continuing the trend that began in late 2007. While Utah has fared somewhat better than its neighboring states, it has not been immune to the economic downturn. Utah had the fastest growing population in the nation in 2008, but like every other mountain state, its total personal income fell in the most recent 12-month reports. Employment levels in the mountain region also declined between 2007 and 2008, largely driven by contractions in Arizona, Idaho, and Nevada. Utah's employment growth was one of the fastest in the nation between 2003 and 2008, but recent figures show this growth has reversed in the last two years, affecting the state's unemployment rate and poverty level. Utah still has one of the lowest unemployment rates in the nation, but this rate has dramatically increased in the past 12 months. Interestingly, data show Utah's poverty rate has decreased over time and in 2008 was significantly lower than the national average.

As population growth continues to outpace employment growth around the nation, growth in total personal income and per capita income has slowed and the mountain region's per capita income fell further below the national average. The entire mountain region also experienced slowed growth in average annual pay per worker between 2007 and 2008. Although Utah's average annual pay per worker remains below the national average, its median household income and median family income rank above the national average.

Population Growth

Even though Utah only ranks 34th in terms of population size, it currently has the fastest growing population in the nation. Between 2007 and 2008, Utah's population grew by 2.5%, although this was a slight decline from its 2006-2007 growth rate (2.6%). The U.S. population grew by 0.9% while the mountain states' population grew by 2%. Of the mountain states, New Mexico had the slowest growth with an increase of 1%. Also, Utah had the largest household size in the nation in 2008, with 3.15 persons per household.

Personal Income Growth

Between 2003 and 2008, the average annual growth rate of total personal income in the mountain region was 7%, compared to a national rate of 5.5%. On average, personal income growth tends to be faster in the mountain states than in the rest of the nation. Five of the mountain states ranked in the top ten nationally for average annual personal income growth between 2003 and 2008, and all of the mountain states had growth rates above the national average. Most of this growth, however, occurred between 2004 and 2006 when the mountain states region's personal income was increasing at an average rate of 8.5% per year. Growth in total personal income slowed in the mountain region between 2007 and 2008, increasing only by 2.9%. Between 2003 and 2008, Utah ranked fifth nationally in terms of personal income growth,

but this growth rate has also slowed substantially in recent years. Between 2008 and 2009, only four states experienced growth (Iowa, Maryland, North Dakota, and West Virginia). Utah, along with the rest of the mountain states, experienced a decline.

Despite the rapid growth which occurred during the 2003-2008 period, total personal incomes of mountain region states were still among the smallest in the United States in 2008. Using personal income as a measure of each state's economic base shows that only Arizona and Colorado had economies larger than the median economy of the 50 states (\$146 billion). In 2008, Utah had the 35th largest economy, placing it between Mississippi and Nebraska in relative size. Vermont had the smallest economy in 2008, ranking just below North Dakota and Wyoming.

The mountain states produced \$806 billion in personal income in 2008, or 6.6% of the nation's total of \$12.2 trillion. Utah accounted for 0.7% of the nation's income and 10.8% of the mountain states' income. It ranks fourth in the region, behind Arizona, Colorado, and Nevada.

Utah's per capita personal income in 2008 was \$31,944, ranking it 49th in the nation. Utah often ranks low in per-capita measures because of the large number of children in the state. The state's per capita personal income annual growth rate from 2003-2008 averaged 4.3%, ranking 31st highest in the nation. The mountain region's per capita personal income was \$37,005 in 2008, representing 92% of the national average (\$40,208). Utah's per capita personal income was well below the mountain states average in 2008, representing 79.4% of the national average. This percentage has fallen slightly since 2003, when Utah was at 80% of the national average.

Median Household Income

While Utah's per capita income ranks low in the nation, its median household income ranks relatively high. The three-year average of median household income (2006-2008) shows Utah ranks 10th in the nation (the Census Bureau recommends using three-year averages for ranking purposes to reduce the volatility that arises from small sample sizes). The discrepancy between the median household income ranking and per capita income ranking is largely explained by Utah's young population as per capita figures are diluted by the large number of children living in the state. In 2008, Utah's three-year average median household income was \$58,820 and represented 114.6% of the national average. This was the second-highest median household income among mountain states.

As mentioned previously, Utah's income ranking can change significantly based on the definition and sample being used. For instance, Utah's 2008 three-year average median family income was \$64,048; this was just above the U.S. average of

\$63,129 and ranks Utah 21st in the nation. Family income is based on the incomes of the householder and any other people living in the same household who are related by birth, marriage, or adoption. Family income does not count single-person households. Household income is based on the incomes of the householder and any other people living in the same household, regardless of whether they are related. Because many households consist of one person, household income is typically less than family income.

The discrepancy between Utah's median household income ranking (10th) and median family income ranking (21st) is explained by Utah's high number of workers per household and few single-person households. Utah is ranked second in the nation in terms of workers per household, but only 16th in terms of workers per family. Having more workers per household contributes to higher incomes. Utah also has fewer single-person households compared to other states, which increases the state's median household income.

Average Annual Pay

Another measure of income is the average annual pay of workers covered by unemployment insurance. Among the mountain states, all but Colorado (\$46,614) were below the national average (\$45,564) in 2008. Utah's average annual pay of \$37,980 per worker in 2008 was 83.4% of the national average and ranked 37th in the nation. Regionally, Colorado, Nevada, Arizona, and Wyoming all ranked higher than Utah, while New Mexico, Idaho, and Montana ranked lower. These states had some of the lowest average pay rates in the nation, with Montana ranking 50th.

One issue to keep in mind is that these annual pay figures are influenced by the number of part-time workers in each state. Data from the Census Bureau's Current Population Survey and American Community Survey show Utah has one of the highest percentages of part-time workers in the United States. Because part-time workers typically earn less money than full-time workers, having a large part-time workforce can reduce the state's average pay. For instance, in 2008 Utah's average annual pay was 83.4% of the national average, but Utah's average earnings for full-time, year-round workers is actually much higher, at 91.3% of the national average. Utah's lower incomes are also influenced by the state's young working-age population.

Nonfarm Payrolls

The mountain states region experienced a decline in employment in 2008, a trend among about half of the states. Twenty-eight states contracted slightly in 2008, showing early signs of the larger employment contractions the rest of the nation would experience in 2009. Between 2007 and 2008, employment declined at a rate of -0.4% nationally. Utah's growth rate between 2007 and 2008 was 0.2%, ranking it 18th nationally.

The latest employment figures from September 2009 show a significant decline in Utah's employment from one year ear-

lier (-4.1%). This ranks Utah 26th in the nation for job growth in that 12-month period, although no states actually experienced positive growth in that time. The mountain states have some of the largest declines in the country, with Arizona, Nevada, and Idaho ranking in the bottom ten states in terms of employment growth.

Unemployment rates were higher in 2008 than in 2007 for all mountain states, and the majority of other states in the nation as well. Only four states experienced a decreasing unemployment rate between 2007 and 2008 (Arkansas, Oklahoma, West Virginia, and Wisconsin), an indication of the slowing national economy. Utah's unemployment rate for 2008 was 3.4%, up from 2.7% in 2007. Even with the increase, however, Utah had the fifth-lowest unemployment rate in the nation and the second-lowest unemployment rate in the mountain states.

In September 2009, Utah's unemployment rate rose to 6%, again giving the state the fifth-lowest unemployment rate in the nation. Every state in the nation saw an increase in unemployment rates in the 12-month period between September 2008 and September 2009. Even with the increase, however, most mountain states continue to have low unemployment rates when compared to the rest of the nation. In September 2009, four of the mountain states had unemployment rates in the lowest 11 nationally: Montana (5.9%), Utah (6%), Wyoming (6.2%), and Colorado (6.7%). Only Nevada (13.5%) had one of the top ten highest unemployment rates in the nation.

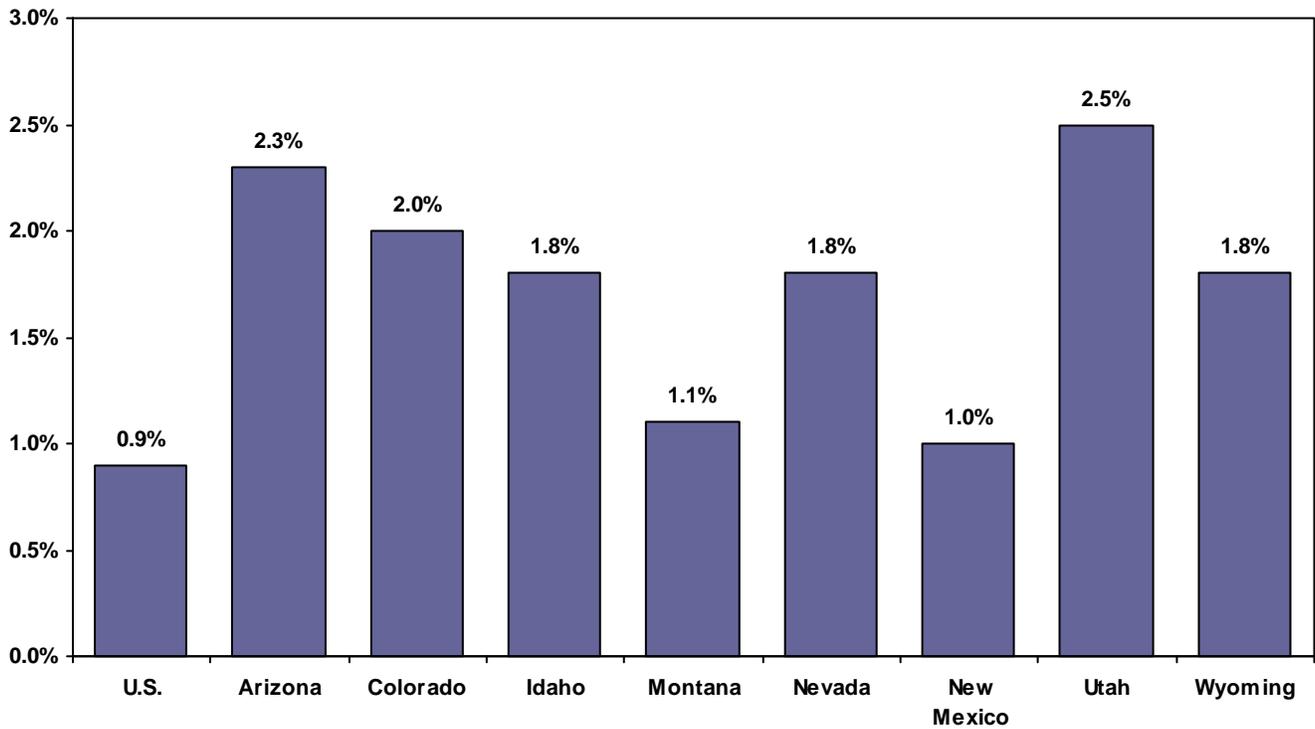

Poverty Rates

Similar to median household income, the Census Bureau's measure of poverty rates has considerable volatility and the Bureau suggests using three-year averages for ranking purposes and two-year averages to evaluate changes over time. There is a wide disparity in poverty rates among the mountain states; New Mexico has the fourth highest poverty rate in the nation with 16.7% of its residents living below the poverty line. Utah's poverty rate fell 0.8 percentage points from 9.4% for 2006-2007 to 8.6% for 2007-2008. From 2006-2008, Utah's average was 8.8% and ranked 7th lowest in the nation.

Conclusion

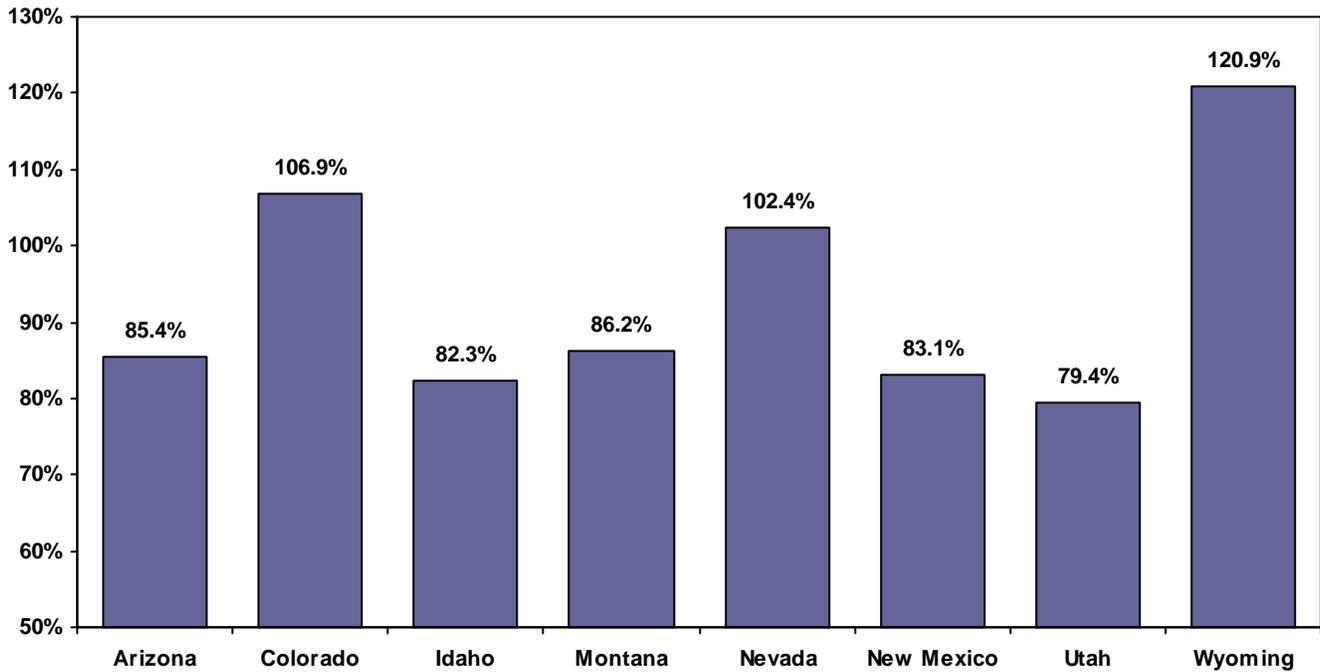

Utah experienced exceptional growth in the mid 2000s, as the state rebounded from the 2001 recession at an amazing rate. The current downturn has now affected the entire country, causing the economies in every state to decline. Even with this decline, Utah still fares well compared to the rest of the nation, with low poverty rates, comparatively low unemployment rates, and median household and family income levels which rank above the national average. These positive aspects may help Utah's economy remain better off than most states as the country rebounds from the national recession.

*Because the sample of households contacted in small population states like Utah is relatively few in number, the data collected for two or three years are combined to calculate less variable estimates. The Census Bureau recommends using two-year averages for evaluating changes in state estimates over time, and three-year averages when comparing the relative ranking of states.

***90% confidence interval +/-" is a measurement of sampling variability for that average.

Note that the confidence intervals for U.S. estimates are much smaller than those for the states, because larger samples sizes produce more accurate estimates.

*The three-year-average is the sum of three inflation-adjusted single-years divided by three. Amounts are inflation-adjusted using CPI-U-RS. Calculations by Utah Foundation. Because the sample of households contacted in small population states like Utah is relatively few in number, the data collected for two or three years are combined to calculate less variable estimates. The Census Bureau recommends using 2-year averages for evaluating changes in state estimates over time, and three-year averages when comparing the relative ranking of states.

**Workers per Household and Workers per Family calculated by Utah Foundation.

*Average Earnings of Full-time, Year-round Workers are based on Census Bureau data on aggregate earnings and population of full-time, year-round workers (ages 16 years and over). Calculations by Utah Foundation.

**The three-year average is the sum of three inflation-adjusted single-years divided by three. Amounts are inflation-adjusted using CPI-U-RS. Calculations by Utah Foundation. Because the sample of households contacted in small population states like Utah is relatively few in number, the data collected for two or three years are combined to calculate less variable estimates. The Census Bureau recommends using two-year averages for evaluating changes in state estimates over time, and two-year averages when comparing the relative ranking of states.

*Statistically significant at the 90% confidence level

**Because the sample of households contacted in small population states like Utah is relatively few in number, the data collected for two or three years are combined to calculate less variable estimates. The Census Bureau recommends using two-year averages for evaluating changes in state estimates over time, and three-year averages when comparing the relative ranking of states.

Notes:

1. The Standard Error is a measurement that indicates the magnitude of sampling variability for the estimates.
2. The standard errors for U.S. estimates are much smaller than those for the states.

Overview

Quality of life is a subjective concept and difficult to measure. The connection between economic performance and quality of life, however, is indisputable. Even with the state of the economy, Utah remained among the top states in terms of quality of life. Utah's transportation infrastructure has become more diverse and is growing. Utah's violent crime rate remained among the lowest in the United States. The poverty rate was below the national average and educational attainment continued to be among the highest in the nation. Utah ranked third in the indicators of child well-being and second highest in overall health status. The combination of these and other measurable data show Utah's quality of life continues to be among the best in the nation.

Utah Quality of Life Information

Utah's Kids Count. The Annie E. Casey Foundation ranked Utah third in the nation, behind New Hampshire and Minnesota, in child well-being in its *2009 Kids Count Data Book*. This foundation tracks indicators of child well-being and determines a state National Composite Rank by the sum of the state's standing on each of the following ten measures: percent low-birth weight babies; infant mortality rate; child death rate; rate of teen deaths by accident, homicide, and suicide; teen birth rate; percent of teens who are high school dropouts; percent of teens not attending school and not working; percent of children living with parents who do not have full-time, year-round employment; percent of children in poverty; and percent of families with children headed by a single parent.

Transportation Choices. The availability of multiple transportation alternatives is an often overlooked quality of life measure. The 2008 American Community Survey showed 75.0% of working Utahns drove alone as their means of transportation to work, 13.1% carpooled, 2.4% used public transportation, 3.0% walked, and 4.6% worked at home. The mean travel time to work was 21.4 minutes. Between 2007 and 2008, the Utah Transit Authority reported a 13.2% increase in the number of passengers using the TRAX light rail system, a 0.1% increase in the number of people using vanpools, a 3.5% increase in the number of people using Paratransit service, and a 6.6% increase in the number of passengers using bus service. Overall, UTA total regular service increased by 12.5%. In the spring of 2008, FrontRunner Commuter Rail opened for service in Davis and Weber Counties which contributed to 3.9% of the increase in ridership. UTA is moving toward building 70 miles of rail by 2015, including FrontRunner South and the Mid-Jordan, Draper, West Valley, and Airport TRAX lines.

Current Data on Social Well-Being

Crime. The Federal Bureau of Investigation's Uniform Crime Reports for 2008 reported the rate of violent crime (murder and non-negligent manslaughter, forcible rape, robbery, and aggravated assault) for Utah was 221.8 per 100,000

people. This was a 5.5% decrease from the 2007 violent crime rate of 234.8 and was sixth lowest in the nation. Compared with a national rate of 454.5 violent crimes per 100,000 people in 2008, Utah continued to have a significantly lower rate of violent crime than the U.S. average.

Education. In 2008, the American Community Survey of the U.S. Census Bureau reported 90.4% of Utahns had at least a high school degree, ranking Utah as the seventh highest state in the nation. The national rate was 85.0%. Utah also ranked 17th in higher education attainment, with 29.1% of persons 25 years and over having obtained a bachelor's degree or higher. The national rate was 27.7%.

Home Ownership. Utah's home ownership rate in 2008 was 76.2%, third highest in the nation. The rate for the nation was 67.8%. The states with the highest home ownership were West Virginia with a rate of 77.8%, Delaware at 76.2%, Michigan at 75.9%, and Idaho at 75.0%. The lowest rates of home ownership occurred in the District of Columbia with a rate of 44.1%, New York at 55.0%, California at 57.5%, Hawaii at 59.1%, and Nevada at 63.6%.

Vital Statistics and Health. Utah's unique age structure affects its ranking among other states on many vital statistics. Data from the U.S. Census Bureau show in 2008, 31.0% of Utah's population was less than 18 years old, the highest percentage in the nation. In addition, the median age in Utah of 28.7 was lowest in the nation. Utah also has the second lowest percentage of the population age 65 and over (9.0%), behind Alaska at 7.3%.

Births. Preliminary data for 2007 from the National Center for Health Statistics revealed Utah's birth rate was 20.8 births per 1,000 people, which is the highest in the nation and substantially higher than the national average of 14.3. In 2007, Texas and Idaho ranked second and third in the nation with birth rates of 17.1 and 16.7 respectively. Vermont had the lowest birth rate in the nation, 10.5. Maine and New Hampshire also had low birth rates with 10.7 and 10.8, respectively.

Deaths. Preliminary data from the National Center for Health Statistics showed the overall death rate in Utah was 5.3 per 1,000 people in 2007, the second lowest in the nation. The age-adjusted death rate in Utah was 6.9 per 1,000 people. The infant mortality rate (deaths of infants less than one-year-old per 1,000 live births) was 5.1 in Utah in 2006, up from 4.5 in 2005. Data from the American Cancer Society revealed the number of Utah deaths caused by cancer per 100,000 people was 100.9 in 2009, the lowest in the nation. The Centers for Disease Control and Prevention reported Utah's HIV/AIDS rate per 100,000 people in 2007 at 44.5, the seventh lowest in the nation.

Health Insurance Coverage. According to the Current Population Survey, approximately 14.5% of Utah's population lacked health insurance coverage in 2008 (three-year av-

erage), ranking Utah 21st highest among the states. The U.S. average was 15.5%.

Poverty. Utah's poverty rate was 8.8% in 2008, the fifth lowest in the nation and below the national average of 12.7%. The states with the lowest poverty rates were New Hampshire (6.1%), Alaska (8.2%), Connecticut (8.3%), and Maryland (8.6%).

Public Assistance. On average there were 11,984 monthly recipients of Temporary Assistance to Needy Families (TANF) in 2008, a rate of 4.4 per 1,000, ranking Utah sixth lowest among states. Approximately 134,180 people in Utah received monthly benefits from the Federal Food Stamp Program in 2008, a rate of 49.0 per 1,000 and the third lowest in the nation behind Wyoming (42.4) and New Hampshire (48.3). The Federal Food Stamp Program dispersed \$27.1 million in benefits in Utah in 2008.

Public Education Overview

In 2009, there were an estimated 563,273 students in Utah's public education system, an increase of 12,260 students or 2.2% over 2008. These students are becoming increasingly diverse and score respectably with their national peers. In FY2006, Utah's per pupil expenditure was \$5,464, the lowest in the nation. Utah's total public education expenditure as a percent of total personal income was 3.7%, ranking Utah 43rd in the nation.

Utah's public education system operates over 800 community-based schools. The system provides an education that continually evolves in order to prepare students for the future, while competing for revenues, land, personnel, and students.

Enrollment

Utah's student enrollment growth has been moderate for several years after peaking at 3.1% in 2006. Enrollment grew by 12,260 students between 2008 and 2009, a 2.2% increase. Utah continues to experience increases in population, and growth in student enrollment is expected to follow suit over the next several years. Natural increase is fueling this growth in enrollment, the result of the grandchildren of the Baby Boom generation beginning to reach school age.

For several years, the incoming class was larger than the previous year's class, which has led to the current age structure of Utah's young student body. In 2008, the trend continues, with a larger kindergarten class. From grade 7 through grade 12, the numbers decline due to lower births in the age cohorts, out-migration, dropouts, and early graduation.

Although Utah's student population is primarily white (82.8%), it is becoming slightly more diverse. In 2009, 14.4% of Utah's student body was Hispanic or Latino, 1.8% was Asian, 1.6% was Pacific Islander, 1.4% was American Indian and Alaska Native, and 1.5% was Black or African American. Hispanic or Latino was Utah's fastest growing group. In 2009, over 100 different languages were spoken throughout students' homes.

Finances

There are economies of scale associated with school size: the larger the school district, the lower the per pupil expenditure. The marginal cost of adding one student to a large, urban class is minimal. Conversely, the per-pupil cost of operating a rural school where class sizes are smaller is higher.

The urbanization of Utah's population is one reason why Utah's current per pupil expenditures are so low. In FY2009, Utah spent approximately \$5,706 per student, the lowest in the nation and 58.9% of the national average.

The public education system must continually change in order to effectively incorporate research and technology in the preparation of students of varying abilities for the future. It must compete for tax dollars, personnel, students, and land with developers and political entities. The sources of the Utah Public Education System's funding are federal, local (from property taxes), and state (primarily from income tax).

Achievement

Utah's students continue to score above the national average on standardized tests. The Iowa Test of Basic Skills (ITBS) is administered in grades 3, 5, and 8. In 2009, all three grades scored 8% above the national average.

In addition to a high quality education, a child's success in school is also attributed to factors at home, such as income and parents' education. In 2008, Utah's median household income of \$58,820 ranked as the 10th in the nation and above the national average. The parents of Utah's school children are well educated. For persons 25 years and over, Utah ranks 17th in the percent persons with bachelor's degrees (29.1%) and seventh in the percent of persons with high school diplomas (90.4%).

Private Schools

With approximately 17,000 students attending private schools in Utah in 2007, the state has the lowest private school participation rate in the nation. The percentage of private school to public school enrollees has remained around 3.0% throughout the past decade.

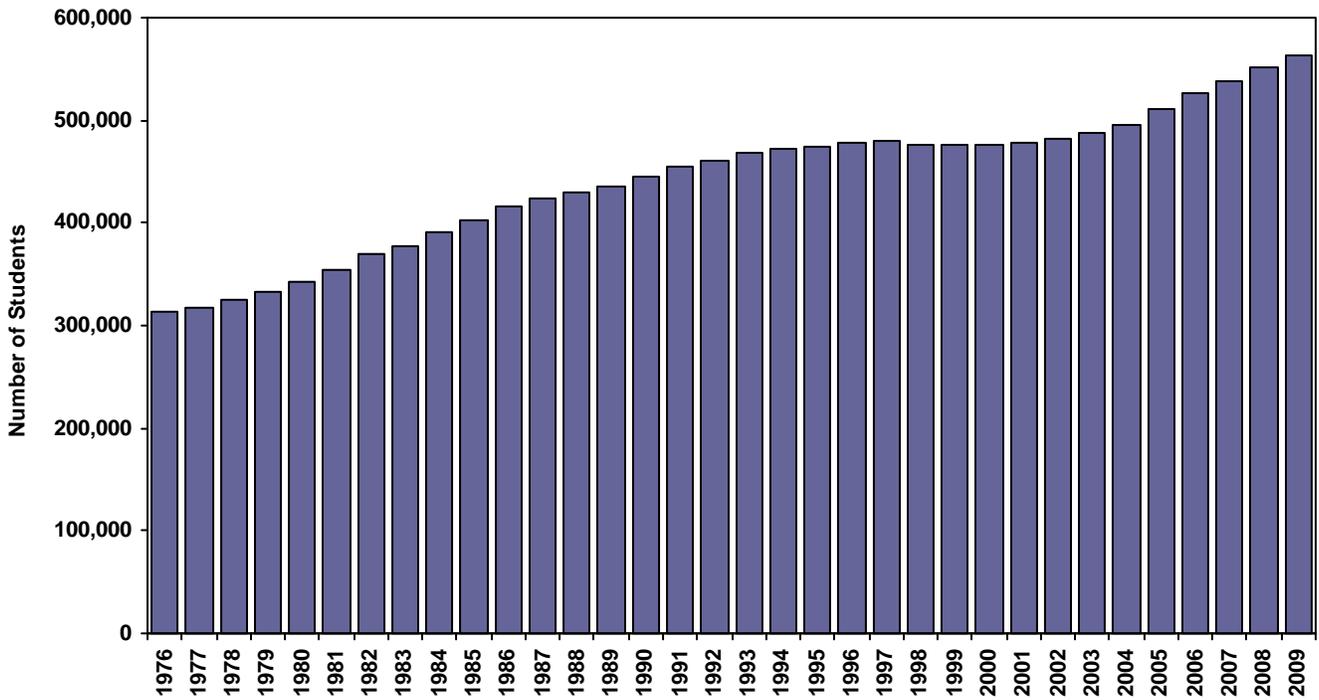

Charter Schools

Charter schools operate independently of school districts, with the exception of a few that are district-operated. They receive public funds and must adhere to federal and state laws and administrative rules for the use of those funds and for the operation of programs. The educational purposes of each vary. For example, Tuacahn High School near St. George offers arts programs, while the curriculum at the Academy of Math, Engineering, and Science in Salt Lake is geared toward college preparation. FY2000 was the first year that charter schools operated within the state. That year, eight schools opened with 390 students enrolled. In 2009, 70 charter schools educated 34,166 students, about 12% of all Utah students in public schools.

2010 Outlook

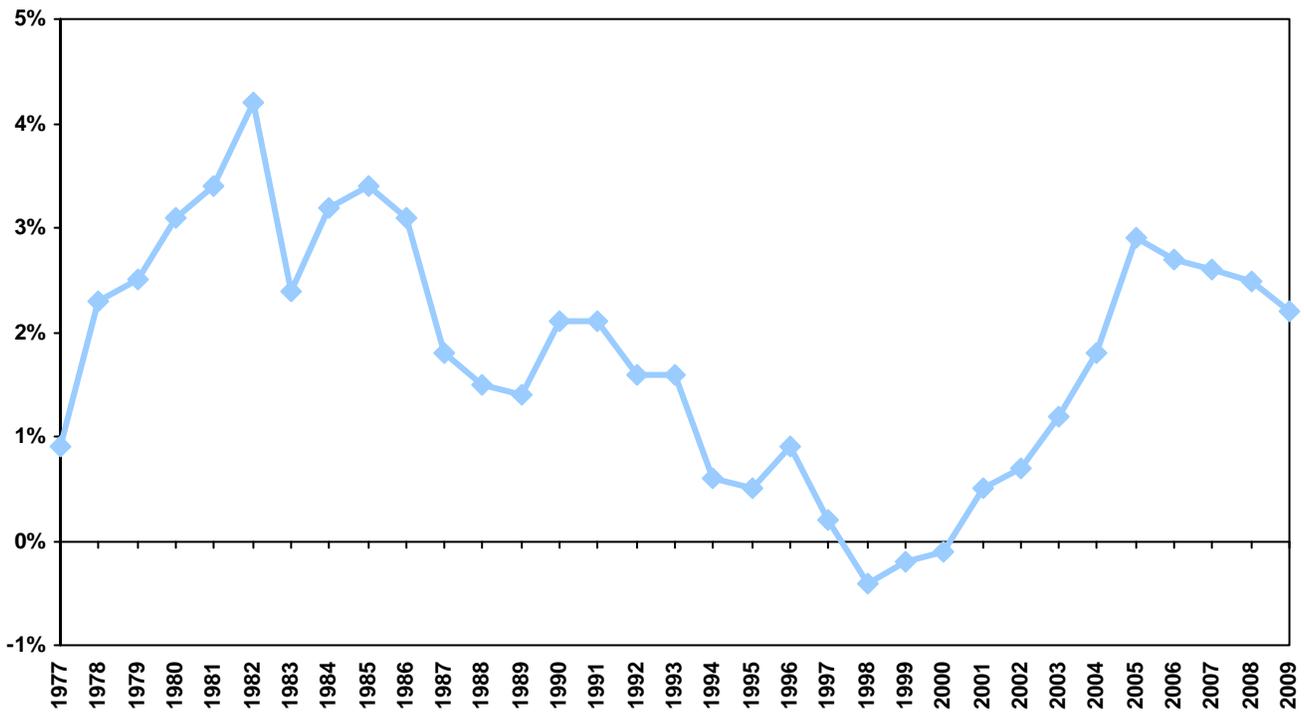

The school-age population will continue to constitute approximately 20% of the state's population. An estimated 11,044 new students are expected to enter the public education system in 2010, an increase of 2.0%.

Notes:

1. Beginning with 2007, Youth In Custody (YIC) counts are no longer included in enrollment.
2. Counts for 2006 were revised to exclude YIC for comparability with 2007 in calculating growth.
3. Utah Schools for the Deaf and Blind (USDB) counts are not included in any years. For 2008, USDB reported 357 students.
4. The Jordan District was divided into the Canyons District and the Jordan District in 2009.

Overview

The Utah System of Higher Education (USHE) consists of 10 public colleges and universities governed by the Utah State Board of Regents, each assisted by a local Board of Trustees. The system includes two major research/teaching universities, two metropolitan/regional universities, two state colleges, three community colleges and a college of applied technology.

Utah System of Higher Education

College of Eastern Utah is an open-access, comprehensive community college with a mission of providing general and liberal education as well as applied technology programs leading to Associate of Arts, Science or Applied Science degrees. In 2009, the Board of Regents voted to merge CEU with Utah State University; this recommendation will be considered by state legislators during the 2010 General Session.

Dixie State College of Utah is an open access, comprehensive community college with a mission of providing general and liberal education as well as applied technology programs leading to Associate of Arts, Science or Applied Science degrees. Certificates are awarded for short-term and applied technology programs. The upper division consists of selected Baccalaureate degree offerings.

Salt Lake Community College is an urban, multi-campus open access, comprehensive community college with a mission of providing applied technology education as well as general and liberal education leading to Associate of Arts, Science, or Applied Science degrees. Certificates are awarded for short-term and applied technology programs.

Snow College is an open access comprehensive community college that offers a broad range of general/liberal education and vocational/technical programs leading to Associate of Arts, Science, or Applied Science degrees. Numerous specialized short-term vocational training certificates and diplomas are also offered.

Southern Utah University is a regional, comprehensive, undergraduate institution with a broad program of liberal and professional education, and is a primary center for service and cultural programs designed to advance the Southern Utah area. Selected masters programs are also available.

University of Utah is the largest university within the state system. It maintains significant programs of sponsored research and of graduate, professional, and undergraduate education in 15 colleges and professional schools; including law and medical schools.

Utah College of Applied Technology consists of nine campuses located throughout the state. The college provides competency-based, open-entry, open-exit extra-secondary

and postsecondary applied technical education resulting in licensing, certification or skill training for employment. It also offers Associate of Applied Technology degrees.

Utah State University serves as the state's land-grant institution under state and federal legislation and is a primary center of university research and of graduate, professional, and undergraduate education in numerous authorized fields of study.

Utah Valley University consists of two interdependent divisions. The lower division embraces the mission of an open access comprehensive community college which provides general and liberal education as well as applied technology programs leading to Associate of Arts, Science, or Applied Science degrees. Certificates are awarded for short-term and applied technology programs. The upper division consists of programs leading to baccalaureate degrees in areas of high community demand and student interest.

Weber State University is a student-centered institution focused on two- and four-year programs with a strong commitment to applied learning in technical, professional and liberal education. Selected masters programs are available.

The USHE institutions are committed to providing challenging and useful instruction, and a well-rounded student life that includes cultural and athletic activities, counseling and career services, and wellness programs. The Utah System of Higher Education offers various programs of study, from certificates to doctoral and professional degrees. Higher education represents an investment in the future of students, families, communities, and the state. USHE is committed to "building a stronger state of minds" by enhancing student preparation, participation, and completion.

Benefits of Higher Education

Students who attend institutions of higher education obtain a wide range of personal, financial, and other lifelong benefits; likewise, taxpayers and society as a whole derive a multitude of direct and indirect benefits when citizens have access to postsecondary education.

Higher education institutions provide critical resources to the economic vitality of the state. There is also a tremendous individual benefit for those with degrees in higher education. There is a positive correlation between higher levels of education and higher earnings for all racial/ethnic groups and for both men and women. In addition to earning higher wages, college graduates are more likely than others to enjoy employer-provided health insurance and pension benefits. Any college experience produces a measurable return when compared with none, but the benefits of completing a bachelor's degree or higher are particularly large.

Enrollment

Higher education enrollment in Utah has almost doubled

over the past 20 years. Enrollment in the nine Utah colleges and universities increased in fall semester 2009 with 12,632 additional students, an 8.3% increase over the fall 2008 semester headcount. Enrollment is projected to continue to increase over the next ten years.

Utah's higher education population is becoming increasingly diverse. Third-week enrollment data from the Fall Semester of 2009 lists 75.7% of students as White, 5.4% as Hispanic or Latino, and 5.6% as Asian, Pacific Islander, Black, American Indian, or Alaskan Native. The remaining 13.4% of students did not indicate a race or ethnicity, including the 2.8% who are international students.

Financing

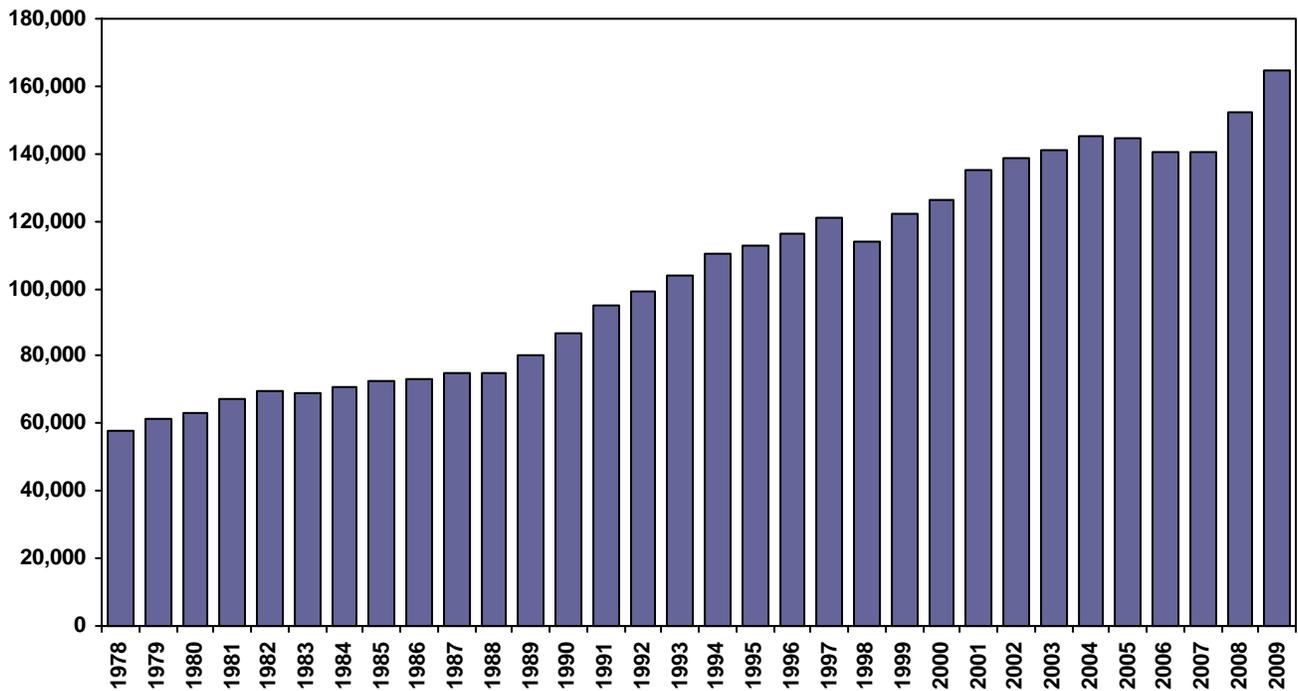

Higher education is funded primarily from state funds. The General and Education funds total approximately 50% of the higher education budget. Student tuition accounts for approximately 37% of the higher education budgets. Governor

Herbert recommends continuing the one-time backfill money for FY2011 which was appropriated for FY2010. This action would allow higher education to maintain current funding levels and save approximately 700 Full-Time Equivalent positions.

Degrees and Awards

While Utah has one of the highest high school graduation rates in the country, the percent of Utahns with a bachelor's degree is only slightly higher than the national average—28.7% in Utah, and 27.5% nationally. USHE institutions awarded 26,981 certificates and degrees in 2008-2009. Liberal Arts and Sciences was the top field of study, followed by Health Professions, Business and Marketing, Education, and Social Sciences. The System awarded 12,621 bachelor's degrees in 2008-2009, with the top fields of study being Business and Marketing, Social Sciences, Education, Health Professions, and Communication.

Economic Development Activities

Overview

Despite the recession, Utah maintained a smart, strong and vital economic development program. The Utah Science, Technology, and Research initiative continued to recruit research faculty. Construction progressed on research buildings on the campuses of the University of Utah and Utah State University. Commercial applications of the research developments promise jobs and revenue for Utah's economy. The Governor's Office of Economic Development continued to attract companies to relocate to Utah and assist Utah companies in expanding operations in the state. Centers of Excellence awarded grants to 22 companies to help them bridge the gap between research outcomes and venture capital funding. The Downtown Rising and Falcon Hill projects continue to progress.

Governor's Office of Economic Development Economic Development Tax Increment Financing (EDTIF). The EDTIF Tax Incentive is a post-performance tax credit based on sales, corporate, and withholding taxes paid to the state. It is available to companies seeking relocation to and expansion of existing operations in Utah. In FY2009, the GOED Board extended 17 EDTIF incentive offers, of which 13 have been accepted. Ten of the incentive offers were made to existing businesses within the State of Utah. Counties affected included Salt Lake, Utah, Davis, and Weber. The incentive payments will range from seven to 20 years. The developments are expected to bring 4,026 new jobs, \$3.5 billion in new wages, and \$278 million in new state revenue. The capital expenditure is projected to total \$506 million.

Rural Fast Track Program. In an effort to expand economic development in rural areas of the State, in FY2009 GOED offered 39 grants to companies in 11 counties under the Rural Fast Track Program. This program was established by the legislature "to provide an efficient way for small companies in rural Utah to receive incentives for creating high paying jobs in the rural areas of the state and to further promote business and economic development in rural Utah" (63M-1-904(2)). These companies will bring an estimated 57 new jobs and \$10.3 million in investment to the counties of Beaver, Juab, Millard, Sanpete, Wayne, Carbon, Emery, Grand, San Juan, Duchesne and Uintah. Projects included anesthesia and ventilator machine manufacturing, waste asphalt recycling, and dental prosthetics manufacturing.

Recognizing that alternative energy is a high-growth industry for both power generation and manufacturing of power generation equipment, the legislature in 2009 created the Renewable Energy Development Incentive (REDI) to make Utah "Best in Class" in recruiting both manufacturing and generation companies. HB 430 also provides incentives for nuclear power projects. The program allows for up to 100% of companies' new state revenue (includes state corporate sales and

withholding taxes) to be refunded in the form of a post-performance tax credit for up to 20 years. This bill took effect on May 12, 2009 and multiple companies have already indicated interest in this incentive.

Centers of Excellence Program. The Centers of Excellence Program (COEP) has a 21-year history of helping to mature technologies developed at Utah's colleges and universities and bringing those technologies into the marketplace. The purpose of COEP is to accelerate the commercialization of promising technologies that have value for Utah in helping drive economic development and job creation.

COEP fills a gap in private sector funding. Around the world, the transition of university-developed technologies from the lab into industry is very challenging. These technologies are still in their infancy and carry with them both market and technical risk that has not been mitigated by the research funding that created them. It is too early in their development as businesses for mainstream venture capital firms to be willing to invest in them, and because of their sophisticated technologies, angel investors are typically unable to verify the potential of a given opportunity (i.e. "is this really the next cure for cancer?") The same challenge applies to existing firms that compare the risks and challenges of licensing a university-developed technology versus investing in internal development. For both startups and existing companies, the Centers program is intended to bridge this gap and to provide incentives for private sector investment by reducing the risks inherent in these new technologies.

Beginning in 2008, any company either headquartered in Utah or having a significant divisional headquarters in Utah, is eligible for the Centers of Excellence Program. Any startup or existing company that licenses a new technology developed at one of Utah's colleges or universities that will create jobs for Utah citizens, is eligible to apply for a grant. The competitive process for Centers of Excellence Grants is intended to encourage and develop technologies that create Utah jobs from the commercialization of emerging technology.

In 2009, the key requirements for funding were: 1) the potential for a technology to create a significant Utah employer; 2) whether the proposing team or management team was credible to accomplish the needed commercialization activities; and, 3) for teams already in the program, whether the program was "on track" and meeting key milestones.

In FY2009, 39 proposals were submitted and evaluated by the advisory council in the following areas:

- Materials/Manufacturing/Environment/Energy (10 awarded)
- Information Technology/Communications/Aerospace/Defense/Electronics/Electrical Devices (5 awarded)
- Life Sciences (7 awarded)

Licensees represented several institutions:

- Brigham Young University (8)
- Utah State University (3)
- University of Utah (10)
- College of Eastern Utah (1)

Utah Science, Technology, and Research Initiative

In March 2006, the Utah State Legislature passed Senate Bill 75, creating the Utah Science, Technology, and Research initiative (USTAR). This measure provided funding for strategic investments at the University of Utah (UofU) and Utah State University (USU) to recruit world-class researchers, build state-of-the-art interdisciplinary research and development facilities, and form world-class science, innovation, and commercialization teams across the state. This initiative focuses on leveraging the proven success of Utah's research universities in creating and commercializing innovative technologies to generate more technology-based start-up firms, higher paying jobs, and additional business activity leading to an expansion of the tax base.

In a little more than three years of operation, USTAR is on or ahead of plan in its three program areas – Research Teams, Building Projects, and regional Technology Outreach. As of July 2009, there were an estimated 128 full-time equivalent (FTE) research jobs statewide directly related to USTAR research. The building projects employed an estimated 594 workers.

The USTAR initiative is a long-term, multi-year effort. The initial phase focused on hiring significant researchers, building research facilities, and putting in place an experienced team of technological outreach leadership throughout the state. USTAR has already experienced a significant increase in federal grants attracted to the state, as well as a steady increase in the number of disclosures and patents filed.

From 2008 to 2009, the UofU experienced 16% growth overall in research awards (\$306 million to \$355 million), an impressive performance in a tough economy. Perhaps even more impressive is that USTAR faculty accounted for 27% of this growth, or \$13.3 million in awards in FY2009. USU researchers saw similar increases in extramural funding.

For fiscal years 2007-2009, the state's investment in USTAR research teams totaled \$33.7 million. Based on that investment, these teams have, according to preliminary figures, won more than \$71.3 million in federal and industry grants, leveraging state funds on more than a two-for-one basis. This inflow of funding is just the beginning of the team's financial contribution to the state.

USTAR researchers have made more than two dozen invention disclosures (preliminary to patents) and eight separate patent filings. In terms of employment in FY2009, 128 Full-Time Equivalent (FTE) were employed in USTAR research statewide. To date, USTAR researchers have started four

new companies and attracted two more to the state. This is on track with economic projections developed in 2005 when USTAR was formulated.

Current research efforts supported by USTAR:

- The Biofuels team and USU are leading the effort to develop a pilot facility for extracting harmful phosphates from the Logan city waste lagoon. The facility will harvest algae that consume nitrogen and phosphates and convert them into biofuel.
- Research underway at USU is making advances in transportation infrastructure, energy, public health, and other billion-dollar markets. The Center for Active Sensing and Imaging at USU is developing laser technology called LIDAR which bounces laser light off objects to accurately measure the size, shape, and location of land, buildings, and even air. "Mapping the wind" can help to detect air pollution and site wind farms. This 3D imaging will speed the building of freeway bridges.
- USU's Center for Advanced Nutrition is leading a study to determine whether prevention of cholesterol absorption is more effective when certain plant substances (phytosterols) are used in combination with drug therapy.
- New teams are beginning work on designing simulations for training security, firefighting, medical, and other emergency response teams; veterinary diagnostic tests; and intelligent, self-adapting lights to save energy in commercial buildings.
- UofU has a preeminent research project in geologic sequestration of carbon dioxide. In February, UofU and Headwaters Incorporated entered into a joint venture to offer carbon management services to CO2 emitting companies.
- An array of precisely directed cancer-fighting drugs is being explored by a company formed by UofU researchers. The compounds are able to minimize damage to healthy cells, by only entering cancerous ones to deliver cell-killing agents.
- Research by scientists in the Brain Institute and the Department of Pediatrics is pointing the way to new treatments of cancer, congenital heart disease, mental retardation, and other conditions.
- Nanotechnology research is developing new tools to improve testing and detection. 3D Seismic Special Decomposition Analysis may increase efficiency of oil and gas drilling, reducing costs and environmental damage. Advances in brain imaging will lead to earlier detection and more effective treatment of a variety of mental illnesses. New research and clinical efforts will help reduce suicide rates improving quality of life for military veterans.

Economic Development Corporation of Utah—EDCUtah

Started in 1987 as a private, nonprofit organization, EDCUtah is a public/private partnership, working with state and local governments and private industry to attract and grow

competitive, high-value companies and spur the development and expansion of local Utah businesses. Despite the downturn occurring in every sector of the national economy, economic development activity in Utah did not decline. EDCUtah was involved in the decision of more than 20 companies to come to or expand in Utah. During FY2009, EDCUtah assisted 23 companies that subsequently announced their intention to expand or relocate in Utah.

The following metrics are a result of the efforts of EDCUtah during fiscal year 2009:

- 23 companies relocated, expanded, retained.
- 4,082 new jobs committed.
- 1,093 jobs retained (from companies that had been considering leaving the state).
- 4,478,401 square feet of real estate absorbed.
- \$1.4 billion of new capital investment in Utah.

Downtown Rising

222 Main. The LEED classification system—Leadership in Energy and Environmental Design—is a Green Building rating system, developed by the U.S. Green Building Council, providing a set of standards for environmentally sustainable construction. 222 Main is the first Silver LEED Certified Class A office building in the Salt Lake Valley. It will be open by the end of 2009 and tenants will begin moving in during January 2010. Tenants include the law firms Holland and Hart and Brinks Hofer Gilson & Lione and commercial real estate company CB Richard Ellis. The \$125 million project adds 459,000 square feet of new office space to downtown's Class A inventory.

City Creek Center. The City Creek Center development leads the way in making downtown Salt Lake City the regional center for culture, commerce, and entertainment. With over 1,600 construction jobs on site, work is moving along quickly and the first residential component, Richards Court, will be completed and ready for occupancy in early 2010. The newly remodeled lobby of the Key Bank Tower is complete and the new food court is open and serving customers. The largest residential tower located on the corner of West Temple and South Temple will be completed by the end of 2009. In addition to the role that City Creek Center plays in the economy, injecting more than \$1 million in construction wages and materials per day for the people of Utah, it is also breaking ground in the area of sustainable development. City Center is a LEED for Neighborhood Development (LEED ND) pilot project. It is one of 60 pilot projects in the country selected to participate in a focus group that is helping the U.S. Green Building Council finalize its new LEED ND certification process.

While City Creek and 222 Main are the largest, many other projects are in planning stages, currently under construction, or recently completed. Approximately \$1.6 million dollars is being invested daily in Salt Lake City's central business district. Other projects include:

OC Tanner. Emerging from a \$24 million renovation, the historic Hansen Planetarium building is the new flagship retail location for Utah jeweler, OC Tanner.

Federal Courthouse. Historic Odd Fellows hall successfully relocated to the north side of Market Street clearing the site for construction of the Moss Federal Courthouse. Construction is set to begin in 2010.

UTA Airport TRAX Extension. The highly anticipated TRAX extension to the Salt Lake International Airport is under construction. This project will include the construction of a shortened North Temple viaduct, enhancing transportation between downtown and surrounding neighborhoods.

Utah Performance Center on Main. Salt Lake City recently awarded a contract to Hamilton Partners and Garfield Traub Swisher as the development team for the Utah Performance Center on Main. The Performance Center will include a 2,500 seat theater, attracting first-run Broadway touring shows. Located at 135 S. Main, the project is one of 20 signature projects defined as part of the Downtown Rising plan.

Utah Film Center. Plans are moving forward to convert the Utah Theater to a film center showcasing Utah's independent film industry. The Redevelopment Agency has announced their intention to purchase the theater for this project.

Hyatt Place Salt Lake City. Construction on the 128-room limited service hotel was completed in summer of 2009 offering additional downtown lodging. The new hotel is located on the north side of Gateway with close proximity to the Salt Palace Convention Center, Temple Square, and Energy Solutions Arena.

Salt Lake City Public Safety Complex. A voter-approved \$125 million bond was passed in the November 2009 election. The new Public Safety Complex will replace the current 50-year-old headquarters located at 315 E. 200 South and the project is expected to be completed by 2012.

Gateway Office 6. Proposed Class-A office space is currently being developed by the Boyer Company as part of the Gateway master plan.

In addition to these major projects, 29 businesses have opened or relocated to the central business district in 2009. The majority of these businesses are small, locally owned establishments that have made the decision to invest in the growth of downtown.

The Contribution of Defense to the Economy of Utah

With several military bases in Utah, national defense is a source of significant economic activity. Military personnel consume goods and services. Military establishments employ civilian workers, adding to the wage base of the state. Utah firms provide services to military establishments. Their ex-

penditures and payrolls also circulate through the economy. The major bases are Hill Air Force Base, Dugway Proving Ground, Tooele Army Depot, and Deseret Chemical Depot.

Hill AFB contracted \$2.97 billion in fiscal year 2009. The largest single contract was almost \$800 million to Northrop-Grumman for maintenance on the Minuteman missile. Major announcements this past year include Hill AFB being selected to perform maintenance, repair, and overhaul (MRO) logistics functions for the Air Force's new high-performance jet fighter, the F-35 Joint Strike Fighter, which the Air Force will begin acquiring in 2013, eventually replacing the F-16 Falcon. Hill was selected for an increased workload in their software engineering workstation due to their continued superior performance in this function. The additional software workload will result in the hiring of 300-350 engineers and technicians. Hill was selected to perform maintenance, repair, and overhaul logistics functions for the Predator Unmanned Aircraft System. Hill was also placed on the Air Force's short-list for bases to receive the first operational F-35 Joint Strike Fighters. The Air Force will complete a deliberate stationing analysis to determine the final bases selected for the F-35, but this selection continues to demonstrate the Air Force's commitment to Hill AFB and the excellent workforce on the base.

Dugway Proving Ground contracted out \$85 million in fiscal year 2009. Over 1,400 personnel work at Dugway (26 military, 619 DoD civilians, 776 contractors/tenants). Dugway continues to perform testing of chemical and biological de-

fense equipment for the Armed Forces. Significant events this year include a multi-million dollar upgrade to ranges and laboratories, and the Army's announcement that they will locate their Rapid Integration and Acceptance Center for the Army's Unmanned Aircraft Systems at Dugway, bringing 200-350 jobs to Utah. Major defense contractors are involved in the unmanned aircraft activities and Utah is being viewed as a lead center across the country for unmanned system development, testing, and assembly. Tooele Army Depot has 654 personnel (2 military, 486 Department of Defense civilians, 166 contractors). The Deseret Chemical Depot has 1,555 personnel (2 military, 351 Department of Defense civilians, and 1,202 contractors/tenants).

Falcon Hill

Falcon Hill is the name given to a cooperative effort between the U.S. Air Force, the State of Utah, and several local governments. The United States Air Force, acting under the authority of Title 10, United States Code, and Section 2667 as amended, has launched an Enhanced Use Lease (EUL) project at Hill Air Force Base (HAFB) known as Falcon Hill National Aerospace Research Park (Falcon Hill). The Military Installation Development Authority was formed by the Utah State Legislature as a development authority to facilitate EUL projects on military lands in Utah. Road construction is expected to begin in December, 2009 and work on the first commercial building will begin shortly after. Further details on this topic are in a Special Topics chapter.

Table 81
 USTAR Research Progress

Category	June 30, 2008 Cumulative	June 30, 2009 Cumulative
Faculty hiring activity	15 senior faculty hires	22 senior faculty hires
Research employment	65 FTE	128 FTE*
State investment in USTAR research	\$14.8 million	\$33.7 million

Patents filed or issued	4	8
Companies started in Utah	1	4
Companies brought to Utah	2	2

* In FY2009, 128 FTE include USTAR hires and those externally funded by awarded grants.

** Preliminary figures, subject to revision pending additional university data. Figures include grants submitted in FY2009 and awarded before Sept. 30, 2009.

Industry Focus

Overview

It is estimated most agricultural sectors in Utah were less profitable in 2009 than in 2008 and 2007. Factors included lower commodity prices in 2009 than in 2008. Agricultural receipts in 2008 were greater than they had been for the past several years. Due to record high milk prices in 2008, the Utah dairy sector enjoyed record cash receipts and was the largest agricultural sector, as measured by cash receipts. Cattle, the second largest sector, experienced lower prices in 2009 for the second consecutive year. Hay, the third largest agriculture sector in Utah, showed record high price levels in 2008 and experienced higher-than-average cash receipts. Although most input prices were lower in 2009 compared to 2008, providing some relief to agricultural producers, profitability was lower.

2009 Summary

Cash Receipts. Since 2006, cattle, dairy, hay and hogs have accounted for between 70% and 75% of Utah's agricultural cash receipts. Cattle has long had the highest agricultural receipts in the state at about 33%. But, as a result of declining cattle prices in 2006, 2007 and 2008, cattle receipts also declined to 26.8%, 20.1%, and 19.8%, respectively. As milk prices increased in 2007 and 2008, it replaced cattle as the top industry at 23% and 21%, respectively. Milk prices have declined by about 35% in 2009 while steer calf prices have declined about 2.5% in 2009, making it likely that cattle will once again be the largest contributor to cash receipts in Utah in 2009. Hay prices were at record high levels in 2008, 17.2% of total agricultural receipts, but declined by about 20% in 2009. The hog sector experienced growth in receipts during the first part of the decade, but those receipts, as a percent of the total, peaked in 2005 then declined the next two years. Hog receipts' contribution to the total agricultural receipts increased again in 2008. Hog prices were lower in 2009, so the percent contribution to total receipts are expected to fall.

The greenhouse and nursery sector had experienced growth through most of this decade and surpassed the poultry sector in 2006 at 8.9% compared to poultry's 8.0%. However, receipts from the greenhouse and nursery sector declined in 2007 and 2008 and receipts from the poultry industry increased. For 2008, the poultry industry contributed 9.2% of the cash receipts and the greenhouse and nursery sector contributed 8.0% of the receipts. All other agricultural sectors contributed less than 5% each to the total receipts.

Profitability. It is difficult to determine the profitability of agricultural sectors in Utah for 2009. While most agricultural commodity prices have been lower, so, too, have been many of the input prices. Fuel prices were much lower in 2009 compared to 2008 and fertilizer prices also declined sharply. With lower hay and feed prices in 2009, profitability should have been enhanced for cattle, dairy, hog and poultry producers. However, timing is very important when trying to con-

sider these impacts. For example, many dairies purchase their hay needs in the summer and early fall for the following year. So, although hay prices declined in 2009, it was likely that dairies were still affected by higher 2008 hay prices for at least the first half of the year, before finding relief this past summer. Similarly, cattle, hog and poultry producers may have been paying higher 2008 prices for much of the winter and spring of 2009. This could vary greatly by producer depending upon how far in advance they purchased their feed needs. Profitability of Utah hay producers was certainly lower in 2009 compared to 2008. The relief producers may have had in the form of cheaper fuel, fertilizer and other chemical costs was offset by lower hay prices.

County Data. There were six counties in Utah with more than \$100 million in cash receipts in 2008. In order of rank they are: Utah, Millard, Beaver, Box Elder, Cache and Sanpete. These counties are dissimilar in which agricultural sectors contribute most to cash receipts. While Beaver County is dominated by the hog and cattle sector, with over 90% of agricultural receipts from livestock, Box Elder and Utah counties are more diverse, with many agricultural sectors contributing. Livestock receipts accounted for 51% in Box Elder and 59% in Utah counties of the total agricultural receipts.

Significant Issues

Demand. The main issue facing agriculture in 2009 was the same as that for all other industries: the weak economy. When consumers are uncertain about the future their spending habits are altered, including food purchases. Rather than alter the amount of food purchased, consumers tended to alter where it was purchased. For example, restaurants have struggled during this past year. Consumers may still be eating steaks, but they are buying them at the retail supermarket and cooking at home rather than eating in a restaurant. Some consumers have also traded down in their beef purchases and eating ground beef instead of steaks. This change in demand has depressed agriculture commodity prices. Not only has domestic demand for most agricultural commodities been lower, export demand has also declined. Lower demand has been particularly harmful to the dairy industry.

Dairy. The dairy industry had enjoyed a growing export demand and a strong domestic demand for most of the early part of this decade. As a result, milk prices were increasing, dairies were profitable, and herd numbers expanded. With the financial collapse in 2008 and the subsequent weakness of domestic and export demand, the dairy industry suddenly and unexpectedly found itself with major milk surpluses. In early 2009, market experts calculated that the dairy industry would need to liquidate about 300,000 milk cows in order to return to equilibrium between milk supply and milk demand. Milk prices dropped far below the cost of production in order to clear the market surpluses. Some dairies were not financially strong enough to withstand this unprofitable period and banks foreclosed. Other producers took part in a voluntary

complete herd disposal program and left the dairy business. The dairy cows were sent directly to slaughter and were not purchased by other dairies. While this occurred on a national level and was available to Utah producers, few of them participated in the program. It now appears that those dairies that were able to survive 2009 may see some relief in 2010. Feed prices are much lower and milk prices are increasing.

2010 Outlook

As the economy begins to recover, the agricultural sectors should do the same. Input prices have adjusted to commodity prices and commodity prices appear to be less erratic. In late 2008 and early 2009, commodity prices simply followed the stock market causing uncertainty for producers. A more stable economy should benefit the agricultural economy in 2010. Commodity prices may be more volatile than prior to 2006, however, as corn and other feed grain prices are tied more closely to energy through ethanol mandates.

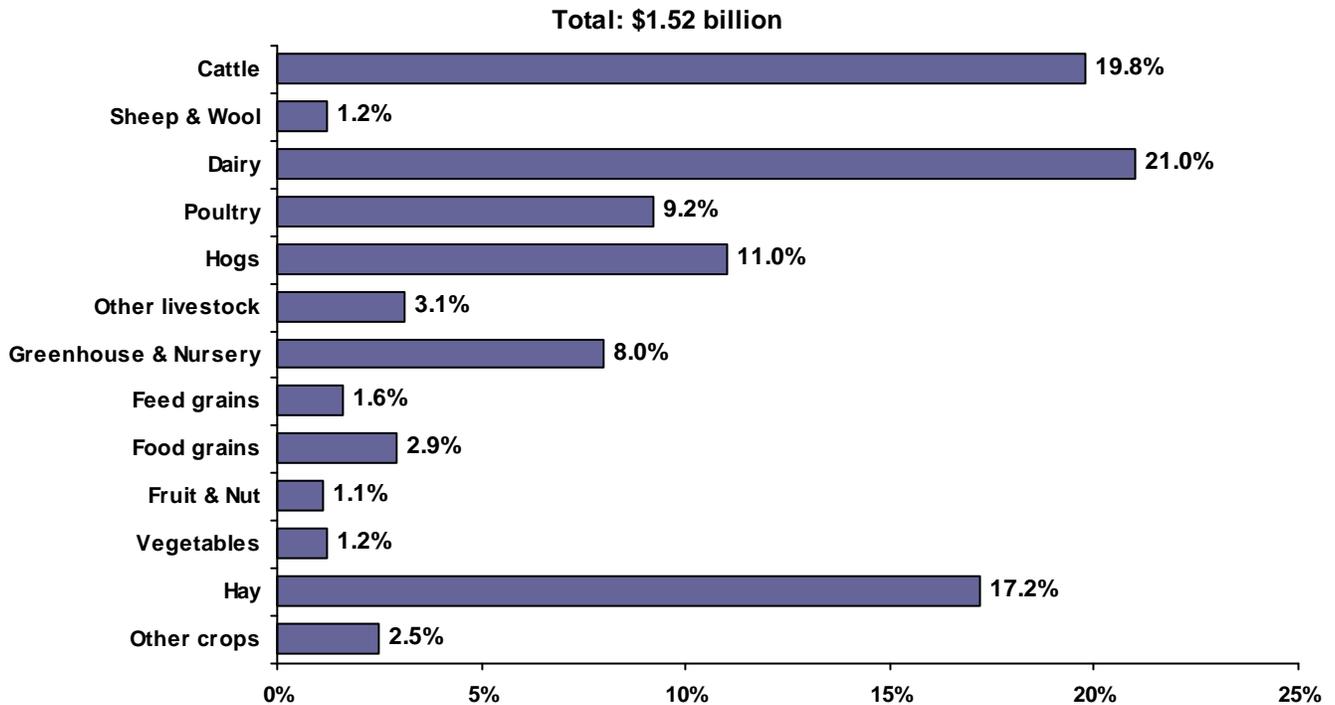

Utah dairy producers should experience lower feed costs in 2010 than in 2009. Milk prices have risen from their lowest levels in early 2009, and are expected to continue rising in

2010. Prices may not increase enough in 2010 to bring substantial profitability back into the dairy sector, but losses should be minimized. Cattle prices are also expected to increase modestly in 2010, to the extent that there is economic growth. Hay prices in the first half of 2010 will not improve much over 2009 levels. There may not be much profitability in the dairy or beef sectors, so there may not be an increase in demand for hay. Export markets for hay may improve as the value of the U.S. dollar declines, which may provide some relief to hay producers in the form of higher prices.

Conclusion

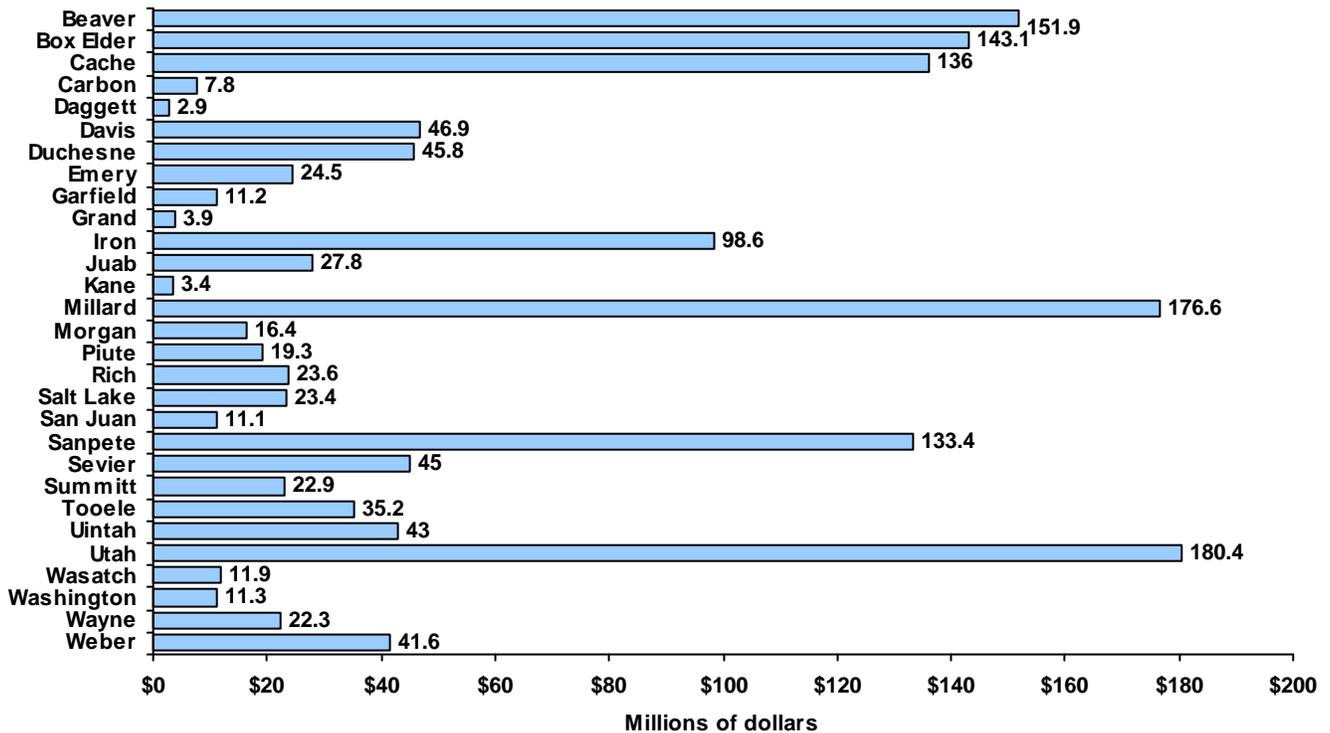

This past year was difficult for most agriculture sectors in Utah. Sharply lower milk and hay prices as well as lower cattle and hog prices impacted many producers. Looking forward, there may be some relief in 2010 in the form of improved prices for these sectors.

Overview

The value of permit authorized construction in Utah in 2009 was \$3.5 billion, the lowest since 1996. In the past twelve months the value of permit authorized construction has fallen 25%. In inflation-adjusted dollars, the value of authorized construction is at the lowest level since 1992. The sharp decline in 2009 was led by the severe contraction in nonresidential construction, which fell from \$1.9 billion in 2008 to \$1.2 billion in 2009, a 37% decline. In addition, the weakness of the residential sector continued although the residential decline appears to be slowing. In 2008 the value of residential construction dropped by 53% compared to 16% in 2009. The value of residential construction in 2009 was \$1.6 billion.

In terms of units, residential construction dropped from 20,500 in 2007 to 10,603 in 2008 and to 10,150 in 2009. The decline of the residential sector was slowed by the unexpected jump in new apartment construction, which grew more than 80%. The surge in apartment construction was due to the availability of financing. The federal government provided loan guarantees for the development of new apartments thus spurring construction activity. In contrast, the value for new condominium and single-family detached housing was lower than in 2008, forced down in part, by the growing share of lower-priced homes and condominiums. Affordability has become a key concern for both home builders and home buyers.

2009 Summary

Residential Sector. The total number of residential units receiving building permits in Utah in 2009 was 10,150, slightly less than the 10,603 permits issued in 2008. From its peak in 2005 of 28,285 units, residential building activity has fallen by 64%. The magnitude of the decline is comparable to the severe housing contractions in the late 1970s and mid-1980s. These two contractions had peak-to-trough declines of 67% and 70% respectively.

The residential sector is divided into two broad categories: single-family and multifamily construction. In 2009, single-family homes accounted for only 46% of new residential construction activity, a substantial drop from its 70-80% historic share. Hardest hit has been the single-family sector which totaled 5,000 units in 2009, down 76% from 2005. In 2009 single-family construction dropped only 9% from the 5,500 units in 2008. The single-family market has probably hit bottom at about 5,000 units.

New residential construction in what were once Utah's high growth cities remains depressed. Residential permits in Eagle Mountain have fallen from 800 in 2007 to about 150 in 2009. Other notable cities with similar results in 2009 are: Draper (70 units), Riverton (130 units), Lehi (225 units) and St. George (200 units). For all these cities, residential construction is down more than 70% from its peak. Only in cities

with large new apartment communities has there been improvement in residential construction activity: Herriman, West Jordan, and Midvale.

In 2009 nearly 3,000 apartment units in Utah received building permits, an increase of 36% over the 2,200 units in 2008. This is the highest level of new apartment activity since 1997 when 3,356 units received permits. This increase in new apartment construction is occurring at a time of rising vacancy rates, flat rental rates and rising costs due to higher turnover and tenants "skipping". Despite these weakening market conditions, developers have moved ahead with new projects, induced by available financing.

The condominium market was relatively robust through much of the boom, driven in part by investor speculation. As the housing market collapsed and prices fell, the condominium market suffered. The number of permits for condominiums in Utah has fallen by 22% in 2009. The number of condominiums receiving building permits in 2009 was 1,700 compared to 2,200 in 2008.

A small category of building type classified as detached single-family homes is manufactured homes and cabins. This type of building activity is concentrated in rural areas. In 2009 building permits were issued for 300 manufactured homes and cabins compared to 546 in 2008, a decline of 45%.

Nonresidential Construction. Permit authorized nonresidential construction is comprised of a number of construction types: most prominent are office, industrial and retail buildings and hospitals. Not included are non-permit authorized construction such as highway and road construction and federal, state and local government buildings including schools. While permit authorized activity has dropped significantly in 2009 some of this decline has been offset by fiscal stimulus spending on highway, roads and government buildings. Unfortunately there are no data available on non-permit authorized construction activity. All of the nonresidential construction valuations presented in this section are for permit authorized construction.

In 2009, permit authorized nonresidential construction in Utah was \$1.2 billion, \$700 million less than in 2008. This 37% decline is the steepest one-year decline for the nonresidential sector since record keeping began in 1950. The \$232 million EBay data center in South Jordan accounted for nearly 20% of total nonresidential construction value in the state in 2009. In real dollars the \$1.2 billion in 2009 is the lowest level of activity since 2002.

The retail sector has experienced the most difficulty. Construction valuation for new retail space fell from \$358 million to \$125 million in 2009, a 65% decline from 2008. Office building construction dropped almost in half, from \$250 million to \$120 million. For hospitals, new construction fell

from \$118 million in 2008 to \$40 million in 2009, a 66% drop. The Ebay project mitigated losses in industrial new construction, nevertheless this sector declined 22% in 2009, \$350 million compared to \$450 million in 2008. Most of the building permits for City Creek Center, the large mixed-use project in downtown Salt Lake City have been reported in prior years. Consequently this project did not provide much support for the sector in 2009.

Significant Issues

From the fall of 2007 to the summer of 2009 the unsold inventory of new homes posed a serious problem for Utah's home builders. At its worst, the unsold inventory reached nearly 3,500 homes statewide but by year's end the excess inventory was absorbed. The state-sponsored Home Run Grant program, which provided \$4,000 to \$6,000 grants to buyers of new homes combined with the federal tax credit of \$8,000 for first-time homebuyers for the purchase of a home, helped to attract homebuyers back into the market. The unsold inventory is currently around 1,000 units, a figure consistent with healthy home building markets in Utah.

Interest rates have also been a powerful incentive for homebuyers. Mortgage rates averaged about 5% for 2009, the lowest rate since 1956. The Federal Reserve adopted policies to support low mortgage rates, which, in turn, has helped slow the decline in prices nationally, but Utah lags national price performance. Utah's housing price index in 2009 shows that home prices have declined by 6.5% compared to 4.1% nationally. The increasing number of foreclosed homes has put downward pressure on housing prices in Utah. There are currently about 13,000 homes in foreclosure in Utah. A majority of these homes will end up back on the market at distressed prices competing with new and existing homes.

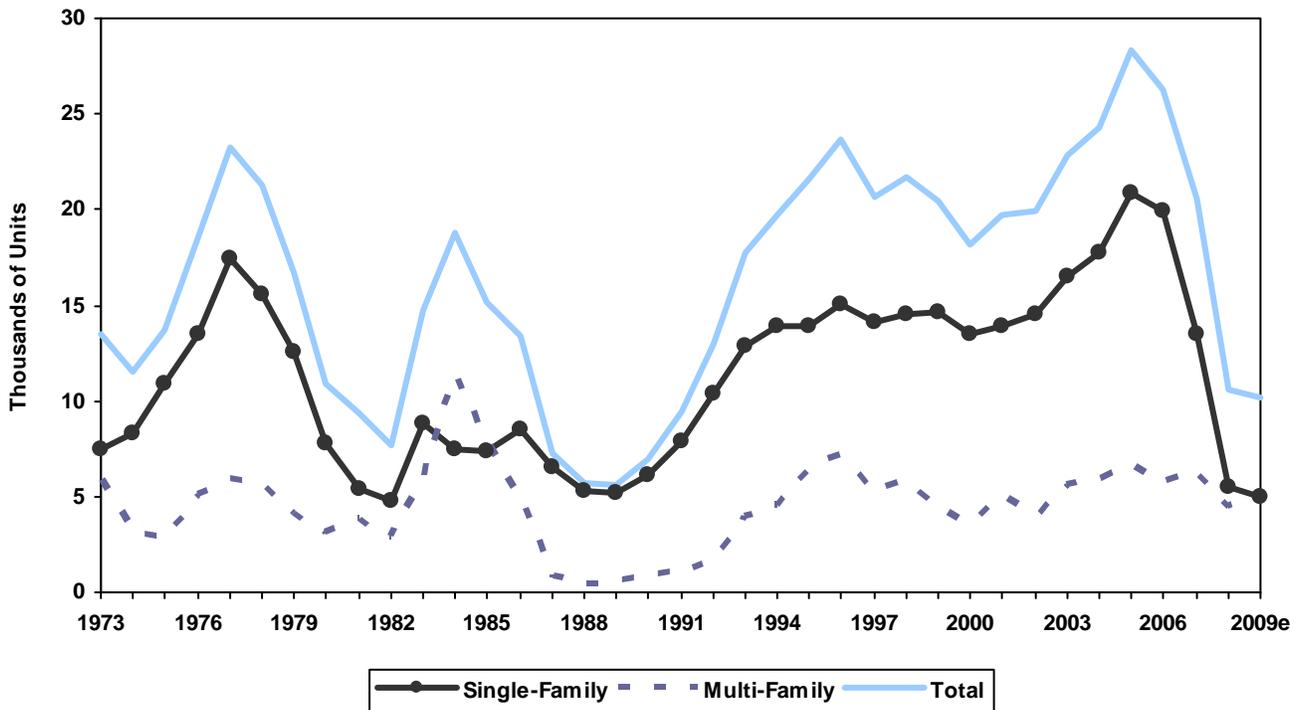

2010 Outlook

This past year was the fourth year of residential contraction. No residential construction contraction in Utah's postwar history lasted longer than five years and recent data suggests the decline in the state's homebuilding industry may have reached a turning point, however, it is likely that 2010 will be very much like 2009, with about 10,150 new dwelling units permitted around half of which will be detached single-family homes. On the nonresidential side, excess capacity and rising vacancy rates will result in further declines in 2010. The value of permit authorized nonresidential construction will drop below \$1 billion in 2010. Both nonresidential and residential markets will be affected by job losses. The loss of 60,000 Utah jobs in 2009 produced uncertainty for home buyers and eroded demand for office, retail and industrial space.

Conclusion

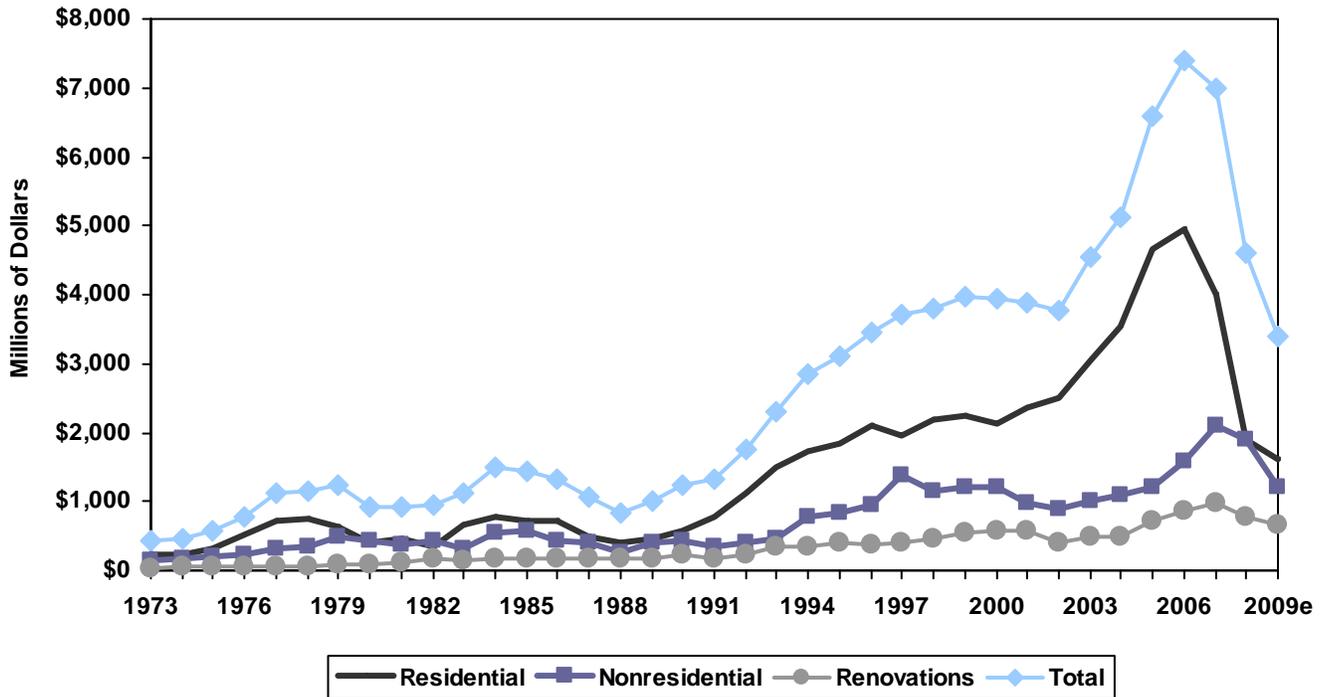

Total permit authorized construction value in Utah in 2009 was \$3.5 billion, which includes \$1.6 billion in residential construction, \$1.2 billion in nonresidential construction and \$650 million in additions, alterations and repairs. The residential market appears to have established a trough in 2009 of 10,150 new residential units, which includes 5,000 single-family new homes. The nonresidential sector is lagging by at least a year and is still subject to steep declines. In 2009, nonresidential value fell 37% to \$1.2 billion—the worst single-year decline in the sector's history. The outlook for 2010 appears better for the residential sector. Further deterioration is unlikely, but the year, at best, will show only marginal improvement as foreclosures and weak job growth prevent a strong rebound. Nonresidential construction will see another year of declines with valuation of new construction dropping to \$900 million, the lowest level since 1993.

Overview

In 2009, Utah experienced a significant increase in crude oil and natural gas production despite the downturn in the economy and significantly lower prices. Conversely, coal production decreased as some companies experienced difficult mining conditions, while other mines unexpectedly closed. Production of coal and natural gas continued to satisfy demand, while crude oil production, despite its recent increase, still accounted for only 44% of Utah's total petroleum product consumption. After starting 2009 slightly higher than the lows experienced in late 2008, Utah's natural gas price decreased to the \$2 to \$3 per thousand cubic feet (Mcf) range and remained there for most of the year. In contrast, Utah's crude oil prices were at their lowest at the beginning of 2009, but steadily increased to year-end, possibly signaling a stronger economy for 2010.

Crude oil production in Utah has increased a remarkable 82% over the past six years, but in order to keep up with demand, Utah had to import significant amounts of oil from other states and Canada. Despite significant increases in natural gas production, consumption of natural gas in Utah suffered a recession-related decrease in 2009, opening up more gas for export to other states. Likewise, production and consumption of electricity decreased from record highs achieved in 2008. With an 11% decrease in Utah's coal production in 2009, exports to other states were significantly reduced to supply a steady in-state demand.

The yearly average wellhead price of Utah's crude oil decreased a remarkable 43% from the record high of \$86.58 per barrel in 2008, to just \$49.50 per barrel in 2009. This recession-related decrease meant that Utah customers paid on average 37% less for diesel and 30% less for motor gasoline in 2009. Similarly, the wellhead price of Utah's natural gas was cut in half—\$6.15 per Mcf in 2008 to \$3.10 Mcf in 2009—which decreased the price for home-heating natural gas by 4.1%. The 2009 average cost of electricity in Utah remained well below the national average.

2009 Summary

Petroleum

Production. Crude oil production in Utah has seen a substantial resurgence over the past six years with new discoveries in central Utah and increased exploration and development in the Uinta Basin. Crude oil production increased to 23.8 million barrels in 2009, up 8.1% from 2008, and up 82% from 2003. Total crude oil pipeline imports decreased by 10.9 million barrels in 2009, giving room at Utah refineries for the increase in Utah production. Of particular note, imports from Canada decreased from 6.4 million barrels in 2008 to 5.2 million barrels in 2009, significantly less than the record 12.2 million barrels delivered in 2004. Refinery receipts, the amount of crude oil delivered to Utah's five refineries, decreased for the third straight year from a record-high 55.1

million barrels of crude oil in 2006 to 53.0 million barrels in 2009. This decrease in demand may be related to increasing motor gasoline and diesel prices, which peaked in 2008, and the subsequent demand-reducing recession of 2009.

Prices. After reaching a record-high crude oil price of \$120 per barrel in the summer of 2008, Utah's crude oil price collapsed to just \$28 by January 2009. As 2009 progressed, Utah's crude oil price steadily increased, finishing the year at about \$70 per barrel and averaging \$49.50 for the entire year—43% lower than the record-high single-year average of \$86.58 seen in 2008. This recent decrease in crude oil price has translated into a significant decrease in motor gasoline and diesel prices. The average 2009 price for regular unleaded motor gasoline in Utah decreased 30% to \$2.22 per gallon and the price of diesel dropped 37% to \$2.40. The value of Utah's produced crude oil decreased from \$1.9 billion in 2008 to \$1.2 billion in 2009, due to much lower crude oil prices.

Consumption. Utah's refined product production remained at 65.2 million barrels in 2009 after reaching a record high of 66.4 million barrels in 2007. This total is expected to decrease in 2010 with the indefinite closure of the Silver Eagle refinery. Refined petroleum product imports from Wyoming via the Pioneer pipeline decreased 13% to 13.0 million barrels in 2009 and are 36% lower than peak imports of 20.3 million barrels recorded in 2005. This decrease most likely resulted from very high product prices followed by decreases in overall demand, but could increase in 2010, replacing products from the temporarily-closed Silver Eagle refinery. Utah's total petroleum product consumption has steadily decreased from a record high of 57.0 million barrels in 2006 to 53.1 million barrels in 2008 as product prices rose to record highs. With lower prices in 2009 and despite a slower economy, consumption is expected to increase 2.5% to 54.5 million barrels. Utah refineries exported 21.4 million barrels of petroleum products via pipeline to other states in 2009, down 0.9% from the year before. Utah exports could soon increase if a petroleum product pipeline from Salt Lake City to Las Vegas progresses beyond the planning stages.

Natural Gas

Production. Natural gas production in Utah has also seen a substantial surge in the past few years as development in the Uinta Basin has significantly increased. Utah produced a record-high 466 billion cubic feet (Bcf) of natural gas in 2009, 5.4% more than in 2008 and 63% more than in 2003. Marketed production and actual natural gas sales also reached record highs in 2009 of 455 and 420 Bcf, respectively. Roughly 15% of natural gas production was from coalbed methane wells, but this percentage has been decreasing as numerous new conventional wells are drilled in the Uinta Basin and existing coalbed methane wells have declining production rates.

Prices. Utah's natural gas price followed a trend similar to crude oil prices, peaking at nearly \$10 per Mcf during the summer of 2008, but then crashing to about \$2.50 per Mcf during the winter of 2009. However, Utah's natural gas price did not recover the way crude oil prices did; instead, it hovered in the \$2 to \$4 range for the remainder of 2009. The average wellhead price for natural gas in Utah decreased 50%, from \$6.15 per Mcf in 2008 to \$3.10 in 2009. This decrease in wellhead price translated into lower consumer prices in 2009. The average price of residential natural gas was \$8.63 per Mcf in 2009, 4.1% lower than the 2008 price of \$9.00. The value of Utah's marketed natural gas reached an all-time nominal and inflation-adjusted high of \$2.7 billion in 2008, based on record production and near-record-high prices. However, record production in 2009 could not make up for the large price decrease, resulting in a decreased total value of natural gas to \$1.4 billion.

Consumption. Natural gas consumption in Utah decreased from a record-high of 231 Bcf in 2008 to 214 Bcf in 2009, reflecting the recession-induced drop in demand. Natural gas consumption at electric utilities has averaged 56.5 Bcf in the last three years, nearly four times higher than the average of 15.2 Bcf consumed between 2000 and 2006, as 1,200 megawatts of new natural gas power plant capacity came online. Natural gas power generation has gained favor in recent years as concerns over greenhouse gas emissions have utilities favoring the cleaner burning fuel to provide quick-start peaking capacity, as well as supplying more baseload capacity. Natural gas consumption in the residential sector decreased from the record-high of 66.0 Bcf consumed in 2008 to 60.3 Bcf in 2009. Industrial use of natural gas also decreased by 12.8% in 2009 to 28.9 Bcf, and is well below peak industrial consumption of 45.5 Bcf reached in 1998. Utah only consumes 46% of in-state production, making Utah a net exporter of natural gas.

Coal

Production. Utah coal production decreased nearly 11% in 2009 to 21.7 million short tons. This decrease was the result of the closure of the Aberdeen (Tower) mine over safety concerns, closure of the Bear Canyon #4 mine due to bankruptcy, and lower production at Dugout Canyon, Skyline, Sufco, and West Ridge due to difficult mining conditions. Lower production also led to a decrease in coal distribution, which totaled 22.3 million short tons in 2009, and resulted in a significant increase in coal imports. Two newly proposed coal mines are in various stages of development: the Lila Canyon mine, located in the southeastern part of the Book Cliffs coal field, currently has a permit and development is underway (production of coal is scheduled for 2011), and the Coal Hollow mine, located in the Alton coal field in southern Utah's Kane County, has obtained a permit to mine on private land (first coal production is expected in late 2010).

Prices. The average mine-mouth price for Utah coal increased to \$29.00 per short ton in 2009 from \$27.78 in 2008.

The spot price for coal in Utah peaked at about \$75 per ton during the winter of 2009, but has since dropped to \$39. This dramatic swing in the spot market has little affect on Utah's mine-mouth price because most of Utah's production is locked into longer-term, lower-priced contracts, thus stabilizing Utah's overall state average near \$30 per ton. The end-use price of coal at Utah electric utilities, which includes transportation costs, increased 12% to \$34.98 per short ton in 2009. The value of coal produced in Utah totaled \$629 million, well below the inflation-adjusted high of \$1.1 billion recorded in 1982.

Consumption. Approximately 17.7 million short tons of coal were consumed in Utah in 2009, 96% of which was burned at electric utilities. Demand for coal in Utah has reached a plateau in recent years, averaging about 17 million tons a year for the past 10 years. This level of demand will continue into the foreseeable future as plans for new coal-burning power plants have been put on hold until carbon regulations are enacted. Coke consumption in Utah ended in 2002 when Geneva Steel went out of business and coal sales for industrial use, mostly cement and lime companies, have averaged 822,000 tons for the last six years. Although Utah imports some coal, it has always been a net exporter, with 6.8 million short tons of coal going to other states and countries in 2009 – down 23.7% from 2008 (most likely due to lower production levels coupled with steady in-state demand), and much lower than peak exports of 15.1 million short tons delivered in 1996.

Electricity (Including Renewable Resources)

Production. Electricity generation in Utah increased to an all-time high of 46,515 gigawatthours (GWh) in 2008, up 6.1% from the year before, but then decreased in 2009 to 42,851 GWh as the recession reduced overall demand. The vast majority, 82%, came from coal-burning power plants; however, electric generation from natural gas plants has increased its share of total generation to 15%, five times greater than just four years ago. Petroleum accounted for 0.1%, mainly used as start-up fuel at coal-burning plants, while renewable resources, mostly hydroelectric (1.2%) and geothermal (0.7%), provided 2.0% of Utah's total electric generation. Utah's second operating geothermal electric plant came online in late 2008 in the Escalante Valley, adding 10 MW of capacity to Utah's electric generation mix, and plans exist for several similar facilities. Commercial-scale wind energy can now be included in Utah's electric generation portfolio as two new wind farms have come online since late 2008. The first, located at the mouth of Spanish Fork Canyon, came online in August of 2008 and consists of nine, 2.1-megawatt (MW) turbines, for a total capacity of 18.9 MW. The most recent wind farm, which came online in November of 2009, is located just north of Milford, Utah, and consists of 97 2.1-MW turbines for a total capacity of 204 MW. All the power from the Milford wind farm will go to customers in southern California.

Prices. Despite a significant decrease in natural gas fuel prices, the higher price of coal – the predominant fuel at electric plants – helped increase overall electricity prices in Utah by 5.5% in 2009. However, Utah's 2009 average electric rate of 6.9 cents per kilowatthour (kWh) for all sectors of the economy is still 30% lower than the national average of 10.0 cents. This is due to Utah's well established coal-fired power plants, which supply 82% of electricity generation in the state. The residential price of Utah's electricity increased 3.9% in 2009 to 8.6 cents per kWh, but is also much lower than the national average of 11.6 cents per kWh.

Consumption. Electricity consumption in Utah decreased 3.9% in 2009 to 26,974 GWh, down from the record-high of 28,073 GWh consumed in 2008. This is the first decrease in electric consumption seen since 1986 and is likely the result of recession-related lower demand. Despite this one-year decrease, since 1980, electricity consumption has averaged a 3.3% increase annually, mirroring Utah's population rate increase (2.3%) combined with the increasing rate of consumption per capita (1.0%). In 2009, residential and commercial demand decreased by 2.5% and 2.1%, respectively, while industrial demand decreased 7.3%. Utah is a net exporter of electricity, using only 63% of in-state electric generation.

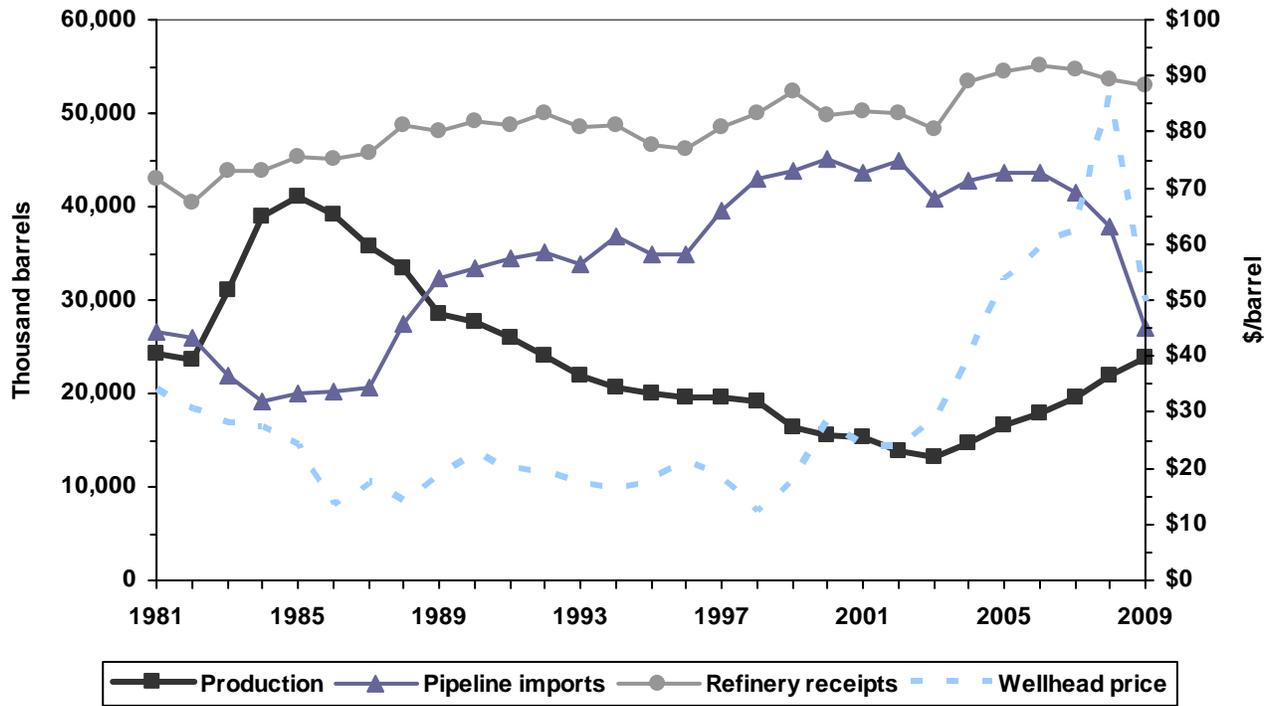

Conclusion and Outlook for Utah Energy

Production and Consumption. Despite recent increases in crude oil production, Utah will continue to be dependent on other states and Canada for crude oil and petroleum products as current Utah production meets only 44% of in-state de-

mand. Conversely, Utah will produce much more natural gas than it consumes, allowing roughly half of total production to be exported out-of-state. Coal production should rebound slightly in coming years with the opening of two new coal mines, while in-state consumption should remain steady as plans for new coal-burning power plants remain on hold. Utah also produces more coal than it uses, allowing roughly 18% of production to be shipped to other states or countries. Electricity generation will remain steady or only slightly increase in the next few years, given that no new large-scale power plants are expected to come online in the near future.

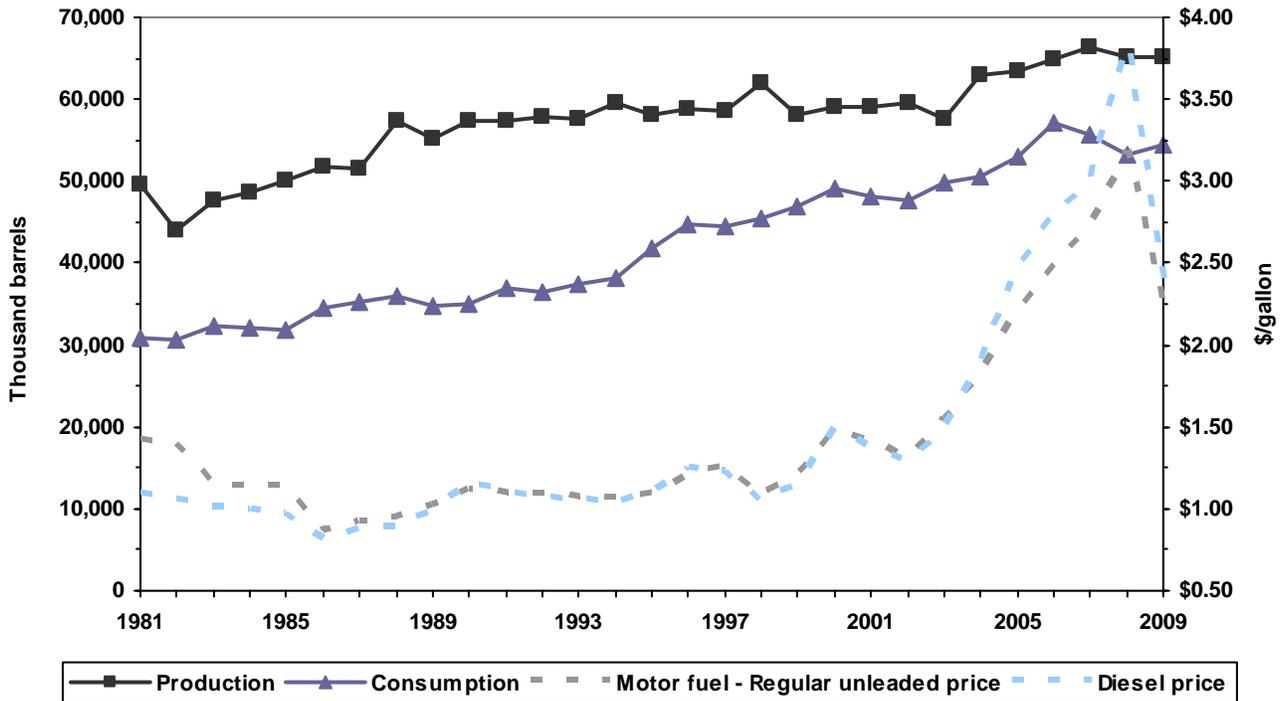

Prices. Utah's crude oil price dropped to a low of \$28 per barrel during the winter of 2009, but steadily increased throughout the year, reaching about \$70 by year-end and averaging \$49.50 for the entire year. Crude oil prices for 2010 are expected to remain in the \$60 to \$70 per barrel range. In contrast, the price of natural gas rebounded in early 2009 to about \$4.50 per Mcf, but subsequently slid to the \$2 to \$4 range and remained there for most of the year. Natural gas prices for 2010 are expected to increase slightly to the \$3 to \$5 range. The spot price for Utah coal reached a record \$75 per ton in early 2009, but then dipped back to \$39 by the end of the year. Utah's mine-mouth coal price is expected to remain steady at just under \$30 per ton due to lower-priced, long-term contracts controlling most of the production. With regard to electricity, Utah's well established coal-fired power plants will assure affordable, reliable electric power for the foreseeable future and help keep Utah's electricity prices well below the national average.

Overview

The gross production value (in inflation-adjusted dollars) of all energy and mineral commodities produced in Utah in 2009 totaled \$6.82 billion, about \$2.57 billion (27%) less than the record high of \$9.39 billion set in 2008. The lower 2009 value is mostly due to decreased base metal and industrial mineral values and decreased crude oil and natural gas prices. The decline of nonfuel mineral values, which peaked in 2006 (in inflation-adjusted dollars), will likely be offset by the increased valuation of oil and gas in 2010.

The Utah Geological Survey (UGS) estimates the nominal value of nonfuel mineral production in Utah was \$3.58 billion in 2009. This is approximately \$768 million (18%) lower than the revised \$4.34 billion for 2008. The U.S. Geological Survey (USGS) ranked Utah fourth among all states in the value of nonfuel mineral production for 2008.

2009 Summary

The UGS estimated value of Utah's mineral production (excluding oil and gas) in 2009 totaled \$4.23 billion, a decrease of about \$819 million (16%) from 2008. Contributions from each of the major industry sectors for 2009 are as follows:

Base metals	\$2.08 billion (49% of total)
Industrial minerals	\$881 million (21% of total)
Energy minerals	\$656 million (16% of total)
Precious metals	\$611 million (14% of total)

Base Metals

Base metal production, valued at approximately \$2.08 billion, was the largest contributor to the value of minerals produced in 2009, accounting for 49% (down from 57% in 2008) of the total value of minerals produced. Base metal values decreased approximately \$816 million (28%) in 2009, due primarily to lower metal prices. In descending order of value, base metal mines produced copper, molybdenum, magnesium, vanadium, and beryllium. No iron ore was produced in 2009. Vanadium is produced as a byproduct in milling uranium. These metals were produced by Kennecott Utah Copper Company (copper and molybdenum) from one mine in Salt Lake County, Lisbon Valley Mining Company (copper) from the heap leaching of previously mined ore from its mine in San Juan County, US Magnesium, LLC (magnesium) from its electrolytic facility in Tooele County using brines from the Great Salt Lake, and Brush Resources, Inc. (beryllium) from one mine in Juab County. Denison Mines recovered vanadium as a byproduct from two uranium mines in San Juan County.

Industrial Minerals

Industrial minerals production (including sand and gravel), valued at \$881 million, was the second-largest contributor to the value of minerals produced in 2009 and accounted for

approximately 21% of the total value of minerals produced. In contrast to the relatively few (six) Large Mines and facilities that produce base and precious metals, approximately 41 active Large Mines and brine-processing facilities and 33 Small Mines produced a myriad of industrial mineral commodities and products in 2008 (latest year for complete data). The total of 74 Large and Small Mines (down from 85 mines in 2007) does not include the more than 120 sand and gravel operations spread throughout the state that are exempt from Utah reclamation rules. The estimated value of industrial minerals decreased approximately \$172 million (16%) compared to 2008, due primarily to decreased production of sand and gravel, crushed stone, cement, and lime, and substantially lower prices for potash and phosphate.

The five most valuable commodities or groups of commodities produced, in descending order of value, were 1) salines, including salt, potash (potassium chloride), sulfate of potash (potassium sulfate), and magnesium chloride; 2) construction sand and gravel and crushed stone; 3) Portland cement; 4) phosphate; and 5) lime, including quicklime and hydrated lime. Together, these commodities contributed 92% of the total value of industrial minerals produced in Utah in 2009.

Energy Minerals

The value of energy minerals (coal and uranium) totaled approximately \$656 million and was the third-largest contributor to the value of minerals produced in 2009, accounting for approximately 16% of the total value of minerals produced. The 2009 value is a decrease of \$52 million (7%) compared to 2008. Approximately 21.7 million tons of high-Btu, low-sulfur coal, valued at \$629 million, was produced from eight mines operated by six companies. More than 500,000 pounds of U3O8 (yellow cake), valued at about \$27 million, was produced from three mines operated by one company in 2009. The coal mines are located in Carbon, Emery, and Sevier Counties and the uranium mines are located in Garfield and San Juan Counties. The value of coal decreased about \$53 million (8%) due to decreased production, which was about 2.7 million tons less than the 24.4 million tons produced in 2008. Coal prices, which have been steadily rising for the past three years, increased again in 2009 and are forecast to increase yet again in 2010. No new coal mines opened during the year, although two new mines are being planned, one new underground mine is being developed, and one new surface mine was permitted. The restart of uranium mining is largely the result of a three-fold increase in yellow cake prices that peaked in 2007. Spot prices declined about 50% in 2008 and 30% in 2009, resulting in the idling of two recently reopened mines, and the delayed opening of several additional mines and the restart of the Shootaring Canyon uranium mill near Ticaboo.

Precious Metals

Precious metals, valued at \$611 million in 2009, accounted for approximately 14% (up from 8% in 2008) of the total value

of minerals produced in Utah. The value of precious metal production was attributed to gold (88%) and silver (12%). Precious metal values increased \$221 million (57%) compared to 2008 due to increased production of both gold and silver and a higher average gold price. The two main producers of precious metals were Kennecott's Bingham Canyon mine, which recovers both silver and gold as byproducts of copper production, and Kennecott's Barneys Canyon mine, which is a primary gold producer. The Bingham Canyon and Barneys Canyon mines are located in western Salt Lake County. Because of high gold prices, Barneys Canyon, which ceased mining in 2001 and was expected to close its leach pad in 2009, will continue to produce gold in 2010.

Active Mines and New Mine Permits

As of mid-October 2009, the Utah Division of Oil, Gas, and Mining (DOG M) listed 99 (112 in 2008) active Large Mines and 197 (206 in 2008) active Small Mines (excluding sand and gravel). In 2008, the most recent year for which data are available, 58 Large Mines and 44 Small Mines reported production, compared to 60 Large Mines and 44 Small Mines in 2007. The Large Mines reporting production in 2008, grouped by industry sector, were industrial minerals (42), base metals (4), precious metals (1), and energy minerals (11), including eight coal and three uranium. The Small Mines reporting production in 2008, grouped by industry sector, were industrial minerals (33), precious metals (5), and gemstones, fossils, and other (6).

Through mid-October 2009, DOGM received three new Large Mine permit applications and 15 new Small Mine permit applications. This is the same number of Large Mine permit applications and a decrease of 18 Small Mine permit applications compared to 2008. All three of the new Large Mine applications were for industrial mineral operations. New Small Mine applications included eight for industrial minerals, five for base metals, and one each for precious metals and energy minerals.

The number of Notices of Intent (NOI) to explore on public lands decreased dramatically in 2009, with just 18 NOIs being filed with DOGM through early November compared to 64 for 2008, and 53 for 2007. The 2009 NOIs included eight for energy minerals (all uranium), five for base metals (copper), four for precious metals, and one for gemstones, fossils, and other.

Nonfuel Mineral Production Trends

According to preliminary data from the USGS, the value of Utah's nonfuel mineral production in 2008 was \$4.17 billion, a 7.5% increase from the \$3.88 billion in 2007. Nationally, Utah ranked fourth in 2008 (same as in 2006 and 2007) in the value of nonfuel mineral production, accounting for approximately 5.9% of the U.S. total. USGS data show that during the period from 1999 through 2008, the value of nonfuel mineral production in Utah ranged from a low of \$1.24 billion in 2002 to a high of \$4.17 billion in 2008. The UGS esti-

mates the value of nonfuel mineral production in Utah for 2009 was \$3.58 billion, 18% lower than the revised nonfuel mineral production estimate of \$4.34 billion for 2008.

During the past five years, substantial increases in metal and mineral commodity prices and increased metals and industrial mineral production led to higher nonfuel mineral values. Most mineral prices peaked in mid-2008 but on average still ended the year higher than 2007. Mineral prices, with the exception of gold, were generally lower in 2008, with some being substantially lower.

Significant Issues Affecting Utah's Mining Industry

Significant short-term issues impacting the mineral industry in Utah include the availability of money to fund exploration and development of new mineral resources, conflicts in commodity leasing (for example, oil and gas versus potash), permitting delays, and the decreased incentive to explore for metal and mineral commodities in a fluctuating price environment. Long-term issues include the change in rural Utah from a resource-based to a tourism-based economy that will continue to have a significant long-range impact on the availability of lands open for exploration and the willingness of the public to reject mineral development in areas they consider environmentally sensitive.

2010 Outlook

The overall value of mineral production (excluding oil and gas) in Utah for 2010 is expected to be flat to modestly lower than 2009 due to decreased copper, gold, and silver production and flat to declining energy mineral prices. Industrial mineral production is expected to decrease moderately, while individual commodity prices (increases or decreases) could vary widely. Industrial minerals that are consumed both locally and regionally will be adversely affected as housing, industrial, and commercial construction continues to decline or remain at relatively low level. Two new coal mines are being planned; one new underground mine is being developed, and one new surface mine was permitted for development. One relatively new copper mine converted to a leach-only operation in 2008 and will produce at a much lower rate in 2010. One new copper mine began operating in 2009 and will add a modest amount to base-metal values in 2010 as it ramps up to full production. A recently rehabilitated iron mine will remain idle until West Coast port storage issues are resolved.

The relatively high price of uranium that averaged about \$100/pound in 2007 (versus a low of about \$8/pound in 2000-2001) has rejuvenated uranium exploration and development activity in the Colorado Plateau province of southeastern Utah. Two mines produced a small amount of uranium in 2007 and three mines produced uranium in 2008 and 2009 before two of those mines were idled in mid-year. The decline in spot uranium prices from \$90 per pound in January 2008 to \$55 in December 2008 and \$45 in November 2009 has delayed plans to open several other uranium mines and the Shootaring Canyon mill near Ticaboo. Lower oil and gas

prices during the first half of 2009 and the lack of investment capital has dampened interest in tar sand and oil shale, but increasing petroleum prices during the second half of 2009 may eventually lead to a significant expansion of Utah's energy mineral production within the next 10 to 15 years.

The number of exploration NOIs received so far in 2009 is abnormally low and may be caused by the lack of money in the local mining market and access to larger sums of money in the venture capital and international mining markets. It is anticipated that this trend of lower exploration activity will continue in 2010 until the commodity and financial markets stabilize and venture capital becomes more readily available.

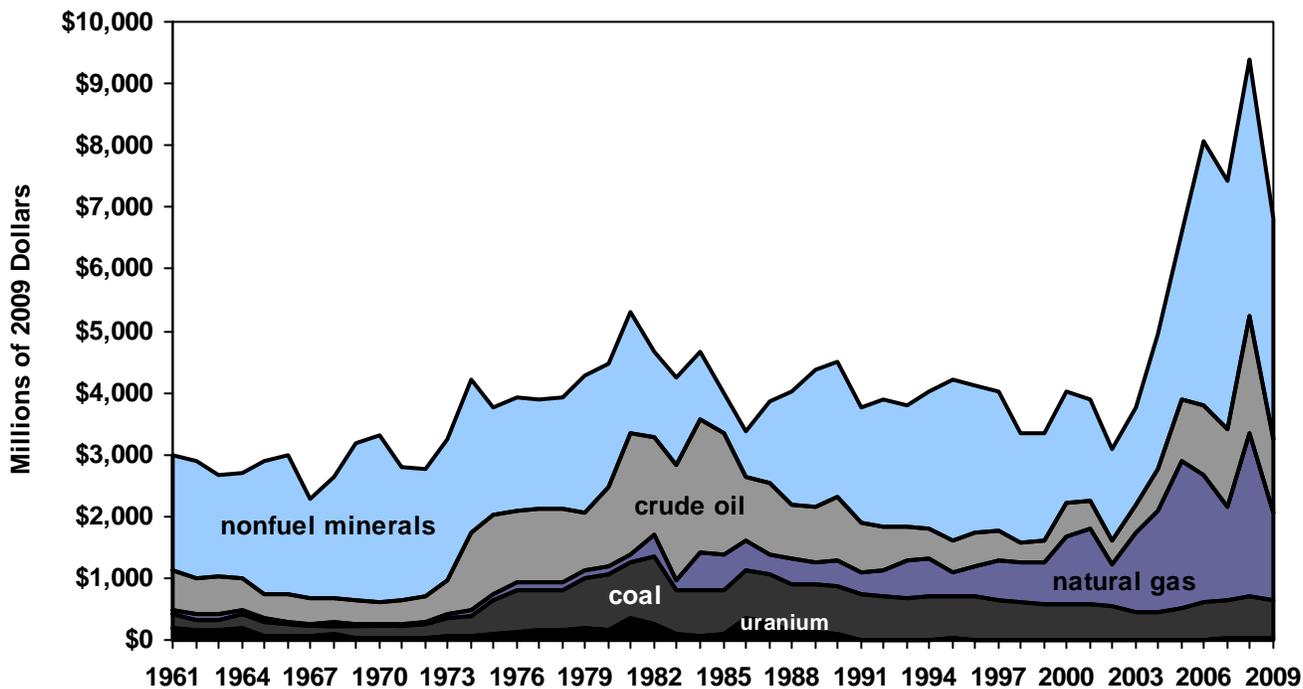

Conclusion

The value of Utah's nonfuel mineral and energy production was about 27% lower in 2009 compared to 2008 because 1) increased base metal production was offset by substantially lower copper, molybdenum, and magnesium metal prices, 2)

decreased industrial mineral values and production, 3) lower coal production, 4) falling spot uranium prices, and 5) significantly lower prices for crude oil and natural gas. The number of producing mines statewide appears to be decreasing over the long term, the overall level of mineral exploration, which increased during 2007 and 2008, decreased abnormally in 2009. This decrease in exploration will likely continue until the world economy becomes more stable and venture capital is more readily available.

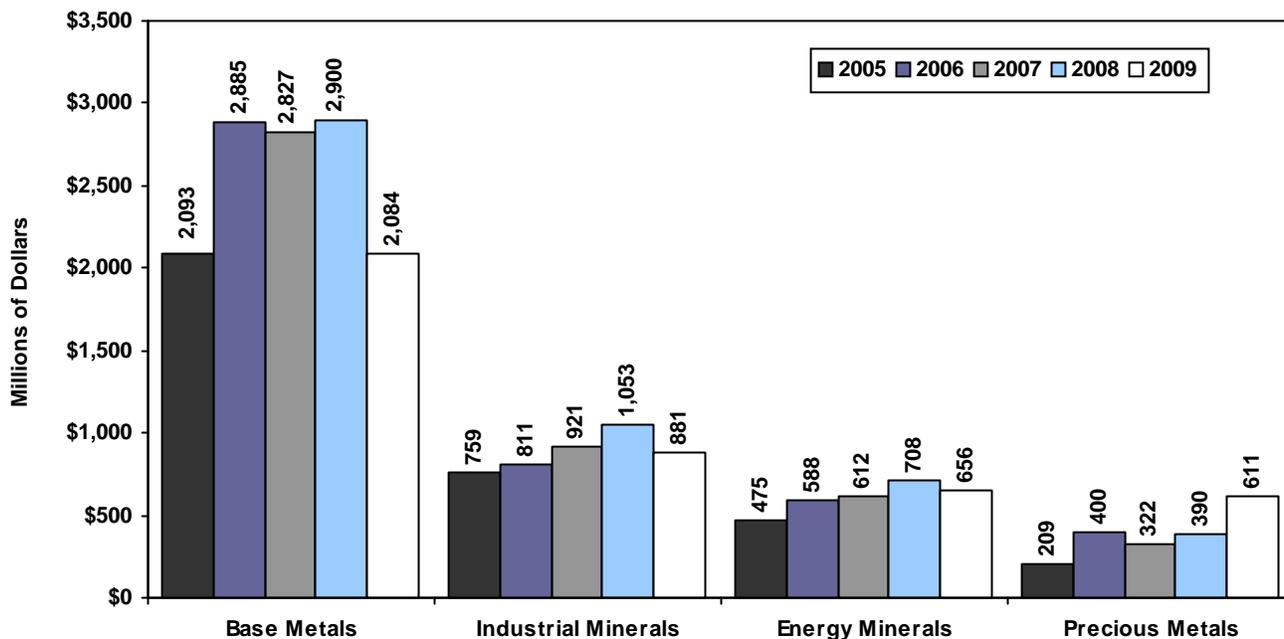

The UGS anticipates that Utah's nonfuel minerals values will be flat to modestly lower in 2010, primarily due to lower base-metal production and flat to declining industrial minerals production. Utah ranked fourth in the nation in the value of nonfuel mineral production in 2008 and the ranking will likely not change for 2009. The resurgence of uranium exploration and the planned reopening of several mines will likely stall until uranium prices rise. The development of Utah's tar sand and oil shale industry still remains several years away.

Overview

Annual employment in Utah's high-technology sector averaged 68,966 in 2008, an increase of 4.3%, or 2,839 more workers than the average annual reported in 2007. Total wages paid in the sector were almost \$4.6 billion, or 9.8% of all nonfarm wages paid in 2008. The average annual wage in the technology sector was \$66,372—76% higher than the statewide nonfarm average.

Utah's technology sector includes more than 4,400 companies operating in 21 different industries. Of these industries, 14 posted employment gains in 2008. The computer systems design industry showed the strongest growth, accounting for 43% of the sector's annual average increase in 2008. Of the industries losing employment in 2008, the wireless telecommunication industry fared the poorest with the loss of 225 workers.

Employment growth in the technology sector began to slow in December 2008. By February 2009, the sector was posting job losses which continued throughout most of the second quarter of 2009. Technology employment averaged 67,105, a decline of 1,861 workers over the 2008 annual average. The current economic downturn and generally poor performance of the Utah economy during the past year suggest this job loss trend will continue through the remainder of 2009.

2008 Summary

In 2008, employment in Utah's high technology sector averaged 68,966—an increase of 2,839 workers over the previous year's average—an annual growth rate of 4.3%. More than 4,400 companies in 21 industries comprise the technology sector, however, employment is highly concentrated in only a handful of these industries. In 2008, only one industry—computer systems design—reported employment of more than 10,000. Employment in this industry totaled 15,819, accounting for almost 23% of all technology workers. Aerospace products (8,685) and engineering services (8,416) are the second and third largest industries in the technology sector, as measured by employment. Almost half of all Utah's technology workers are employed in these three industries.

Of the 21 industries included in the technology sector, 14 reported employment growth in 2008 for an aggregate increase of 3,278 workers. The largest gains, in real terms, were in computer systems design (1,208), navigational, measuring and electromedical products (396), aerospace product manufacturing (326) and engineering services (322). Seven industries posted losses totaling 439 workers. Most of this job loss occurred in the wireless telecommunications industry with a reported year-over decline of 225 workers.

In general, technology workers are comparatively highly paid. In 2008, the total wages paid in the technology sector were almost \$4.6 billion, and accounted for 9.8% of all nonfarm

wages paid in Utah that year. The average wage for technology workers was \$66,372, or 177% of the statewide nonfarm average wage of \$37,452. Those technology industries reporting annual average wages above \$70,000 included companies engaged in biotechnology research (\$98,802), computer and peripheral equipment (\$76,034), computer systems design (74,913), software development (\$73,429) and navigational, measuring, electromedical, and manufacturing (\$71,750).

Three technology industries reported average annual wages lower than the statewide average. These included satellite telecommunications (\$26,496), motion picture and video production (\$31,566) and optical instrument and lens manufacturing (\$35,027).

Starting in December 2008, employment growth in the technology sector began to slow, and by February 2009 job losses were reported. Throughout the first six months of 2009, on average, 67,105 workers were employed in the technology sector, a decline of 1,861 workers, and drop of 2.7% from the 2008 average. Fourteen industries posted losses of more than 200 workers. The largest losses were in computer systems design (466), internet publishing (342), engineering services (320) and semiconductor and electronic components (294).

Selected Industry Analysis

Computer Systems Design (NAICS 5415). By all measures, computer systems design is the largest industry in Utah's technology sector. Companies in this industry provide a wide range of professional and technical computer-related services. In 2008, there were more than 2,000 firms operating in this industry. As a group, these companies employed 15,819 workers and paid wages totaling nearly \$1.2 billion. Since 2004, this industry has posted remarkable employment growth with the addition of about 4,900 new jobs, increasing at an average annual rate of 7.7%.

Growth in this industry is being fueled by the creation of new companies, not through expansion of any one firm. Since 2005, the number of companies operating in this industry increased from 1,636 to 1,997 in 2008. The vast majority of firms are small, employing fewer than 25 people. Just four companies employ more than 250 workers. These include 3M Company, Altiris (a division of Symantec, Inc.), Interactive Studios Group and Landesk Software.

Preliminary 2009 data indicate this industry is contracting. Average employment for the first six months of 2009 was 15,353, a decline of 466 jobs over average annual employment reported in 2008.

Aerospace Products (NAICS 3364). The aerospace industry was once Utah's largest technology sector with almost 15,000 employees, however, it has been slow to rebound from a series of consolidations and mergers that began in the late 1990s. In 2008, 8,685 people worked in Utah's aerospace

industry, an increase of 326 workers from 2007, and a year-over growth rate of 3.9%. Wages in this industry totaled \$605.6 million in 2008, for an average annual wage of \$69,721, about 5% more than the average annual wage for all technology workers.

Employment in the aerospace products industry is highly concentrated in a handful of very large companies. In 2008, 56 companies operated within the aerospace industry, but more than half the industry employment is in one company—ATK Space Systems. Other large employers include The Boeing Company and Williams International. Each employs more than 500 workers. Companies employing at least 250 workers include Moog, Inc. and Barnes Group, Inc.

Defense and NASA contracting are important sources of revenue for many of the companies in the aerospace sector, and these firms have benefited from spending increases approved in recent years. Preliminary data for the first six months of 2009, however, show an average employment base of 8,476, or a decline of 209 workers. It is unlikely that military spending (an important source of revenue for this industry) will remain at current levels in the long term. Significant reductions in either defense or NASA budgets could have serious consequences for this industry.

Engineering Services (NAICS 54133). The engineering services industry is the third largest technology sector. It continued its steady growth as average annual employment reached 8,416—a year-over increase of almost 4%. Since 2004, this segment of the technology sector has expanded by 38% with the addition of 2,337 new jobs. Wages in the engineering services industry totaled \$549.2 million, and averaged \$65,219 per worker—slightly less than the average for all technology workers, but a significant increase over the average for all nonfarm workers in Utah.

The largest companies in this industry include Lockheed Martin and URS (and its E&G) division. Medium-sized companies include Horrocks Engineering, Inc. and The Boeing Company. Many of the engineering companies in Utah's technology sector are heavily involved in defense contracting. A fair number, however, also provide services to the construction industry, specifically on design-build projects. Nonresidential construction in Utah is expected to end the year down 40% from 2008.

Medical Equipment (NAICS 3391). Utah's medical equipment industry has remained relatively stable over the past four years despite competitive pressures to produce increasingly less expensive medical products. In 2008, 7,613 workers were employed in Utah's medical equipment manufacturing industry, a drop of just 20 workers over the average reported in 2007.

The competitive nature of this industry is underscored by the comparatively low average wage received by workers in the industry. In 2008, total annual wages were \$360.3 million, for an average of \$47,327 per worker, well below the average \$63,495 for the sector as a whole.

Employment in the medical equipment industry is relatively concentrated in a few firms. In 2008, there were 226 medical equipment manufacturers in Utah, just 17 more than were operating in 2005. Of these, six companies account for more than half the industry's employment. The largest company is Fresenius USA, Inc., employing more than 1,000 in 2008. Other large companies (those employing 500 or more) include Becton Dickinson Infusion Therapy, Merit Medical Systems, Inc. and Ultradent Products.

Preliminary data for 2009 show a decrease in both employment and the number of firms operating in the industry. Employment in the medical equipment industry averaged 7,443 during the first six months of 2009, a decline of 170 workers. The number of active firms dropped to 219, a loss of seven companies. It is likely that these losses will continue into 2010 as a competitive pressure to cap medical costs grows.

Outlook

The current economic downturn in Utah has manifested in employment losses in the technology sector. During the first six months of 2009, technology employment averaged 67,105—a loss of 1,861 jobs from 2008.

A large share of the employment gains made in 2008 have been erased with the job losses that occurred during the first half of 2009. Given current economic conditions, it is unlikely that employment growth in the technology sector will return to previous levels until well into 2010.

Due to NAICS code revisions in 2007, the following changes were made:

- ¹ Some establishments in this sector were reclassified to NAICS 334515.
- ² Employment in this sector contains some establishments formerly included in NAICS 3342.
- ³ This code was eliminated in 2007. Some establishments formerly in this sector were reclassified as NAICS 51719.
- ⁴ This NAICS code contains establishments formerly included in NAICS 518111 and NAICS 517910.
- ⁵ This NAICS code has been eliminated. Establishments formerly included in this sector are now in NAICS 517919 and 519130.
- ⁶ NAICS code 519130 includes establishments formerly classified as 516110 and some establishments formerly classified in NAICS 518122.
- ⁷ NAICS 541710 has been eliminated.
- ⁸ NAICS codes 541711 and 541712 include establishments formerly included in NAICS 541710.

Overview

Utah's travel and tourism sector was not immune to the economic recession, but regional and in-state travel helped to soften the downturn. The Utah ski industry experienced the third best season on record. Visitation increased for the third year in a row at national parks. State park visitation was also up.

The outlook for 2010 is cautiously optimistic as it is expected that travel among in-state and domestic leisure travelers could increase. There are still concerns about the weak economy, rising unemployment, the housing market, stock market uncertainty, and transportation weakness, but industry experts have forecast limited growth in 2010.

2009 Summary

Utah's travel and tourism sector, like the rest of the economy weakened in 2009. Total tourism arrivals slipped an estimated 4.4% in 2009 from 20.3 million in 2008. Domestic and international travel were down by an estimated 4.6% and 6.8%, respectively. The number of visitors at Utah's five national parks increased 5.4%.

In 2009, the estimated number of passengers at Salt Lake International Airport declined 3.4%. The overall weakening of the airline industry, drop in business travel, decrease in skier visits, fuel cost uncertainty, and economic recession put enormous pressure on airlines. The direct flight from Paris, France to Salt Lake City continues to be successful. Due to the H1N1 virus the direct flight from Tokyo, Japan to Salt Lake City, was temporarily suspended. Resuming the non-stop flight in the spring of 2010, implementing the visa waver agreement between the United States and South Korea and a growing number of mainland Chinese tourists should increase visitors from Asia.

The 2008-2009 ski season was the third best on record. Utah skier visits were 3.9 million. The amount of snowfall was above normal and international, domestic, and local skiers took advantage of the great skiing conditions. Once again, Utah resorts were ranked very favorably by major ski publications, and the resorts continue to make yearly infrastructure improvements.

The following are some trends and attitudes in domestic leisure travel – the “new normal”:

- Vacationing is still considered a “right”.
- Leisure travelers are driving instead of flying – staying closer to home – camping, or staying in budget hotels.
- Travelers are “trading down, not out”.
- Between 2000 and 2009, leisure travelers reported a significantly higher percentage of weekend trips. The increasing use of weekend trips reflects household budget constraints and the “right” to get away.

The Internet continues to play a key role in travel planning. Leisure travelers use the Internet to make travel reservations. This is attributed to a belief that the best deals are online.

Current estimates for traveler spending showed a decline of 10% in 2009 to \$6.2 billion. Total travel-related employment was 110,508 in 2009, accounting for approximately 9.3% of total Utah nonfarm jobs, and approximately 3.6% lower than 2008.

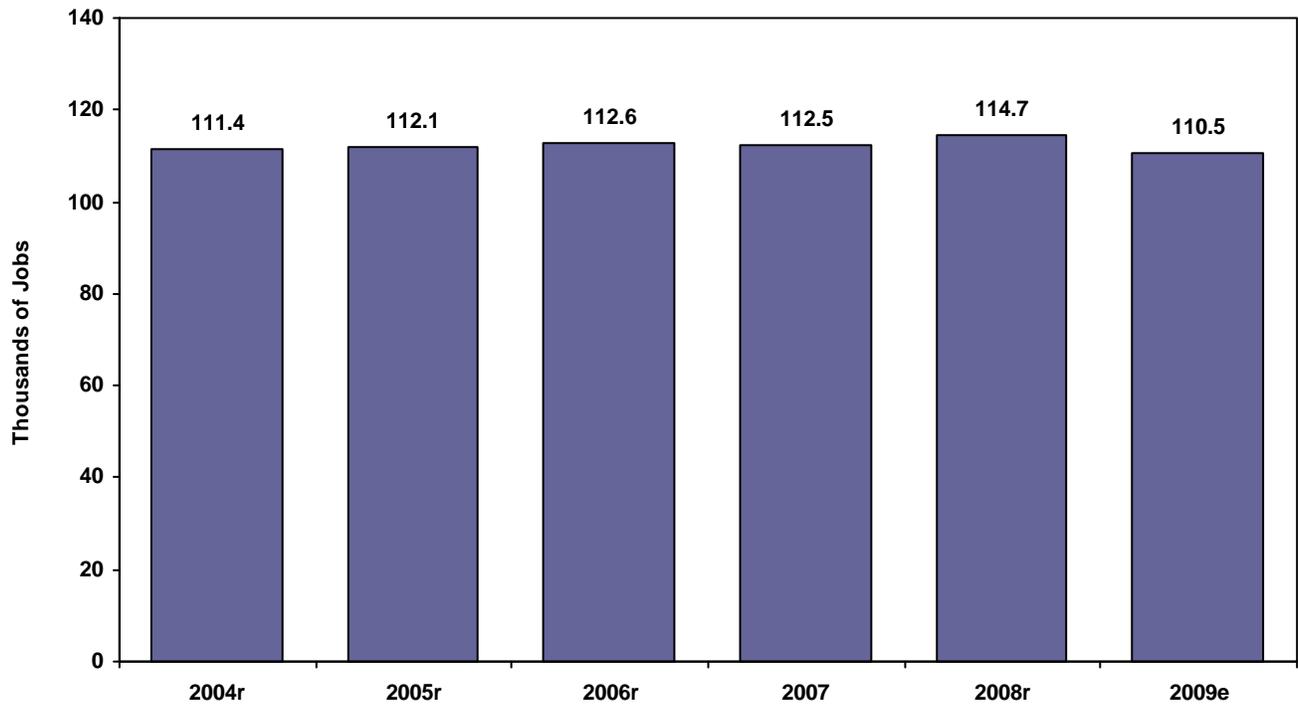

2010 Outlook

The outlook for 2010 is cautiously optimistic. Despite factors such as a weak economy, uncertain stock market, housing turmoil, and tepid consumer confidence, Utah tourism is expected to show a modest increase in travel. Slow but steady growth in in-state and domestic leisure travel should occur.

Additionally, travelers continue to show strong interest in national parks, from which Utah should benefit. Several of Utah's resorts again received high rankings from major ski publications and hope to build on the 2008-2009 season.

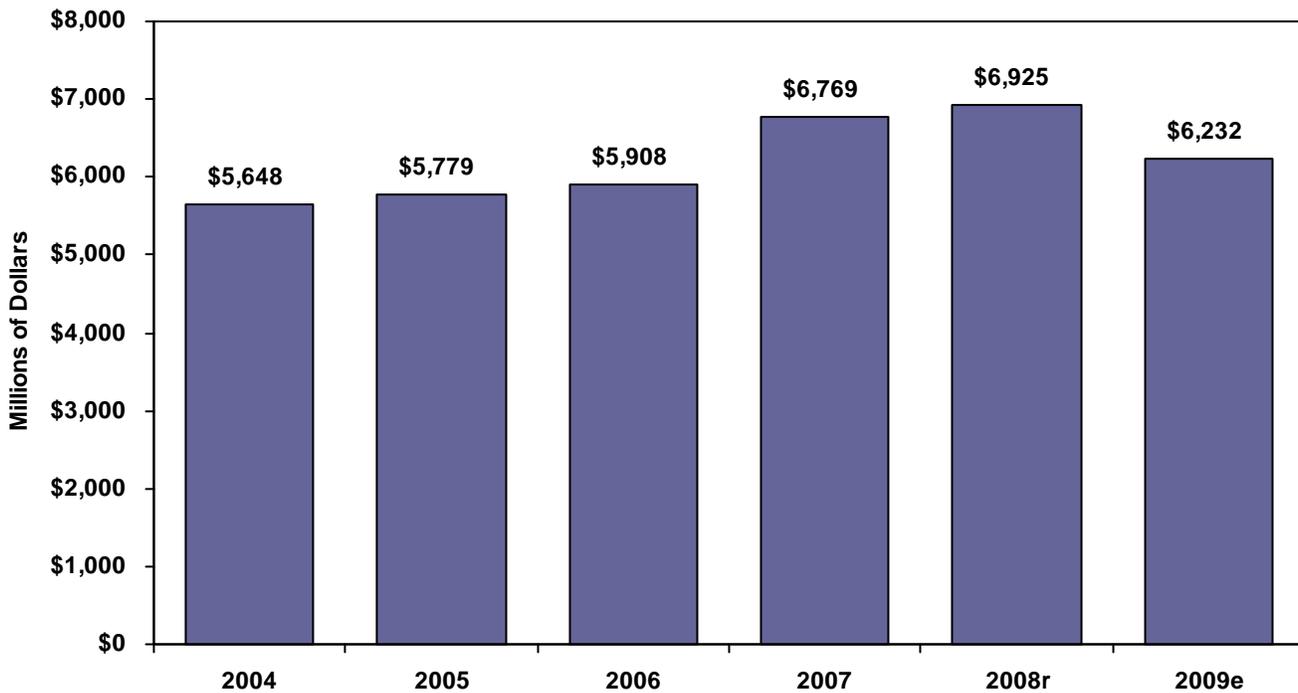

Competition among nearby destinations for the local and regional markets will continue to intensify. National trends highlight opportunities in key segments of the travel market including adventure travel, cultural and heritage tourism, nature-based travel, and family travel. Utah is well positioned to attract these visitors.

Falcon Hill at Hill Air Force Base

Overview

Falcon Hill is the name given to a cooperative effort between the U.S. Air Force, the State of Utah, and several local governments. The United States Air Force, acting under the authority of Title 10, United States Code, and Section 2667 as amended, has launched an Enhanced Use Lease (EUL) project at Hill Air Force Base (HAFB) known as Falcon Hill National Aerospace Research Park (Falcon Hill). The Military Installation Development Authority was formed by the Utah State Legislature as a development authority to facilitate EUL projects on military lands in Utah. Road construction is expected to begin in December, 2009 and work on the first commercial building will begin shortly after.

Background

The Military Installation Development Authority (MIDA) was established by the Utah Legislature in 2007 to facilitate the development of underutilized military land in the state. It functions under the direction of a seven-member board, five members (including three mayors of cities adjacent to military installations) appointed by the Governor and one each appointed by the President of the Senate and the Speaker of the House of Representatives.

Acting under authority of Title 10, United States Code, and Section 2667 as amended, military installation leaders may identify underutilized land on an installation and offer it for development by the private sector under an Enhanced Use Lease (EUL) agreement. This arrangement brings federal land into private taxable commercial use resulting in new jobs and taxes for the state and local governments. The military benefits by using in-kind lease receipts for installation upgrades not funded under military construction appropriations. A military installation can be modernized thereby fortifying existing workload, increasing new mission opportunity and extending installation longevity.

MIDA assists in the development process in a variety of ways, the collection of taxes (including tax increment financing) and applying them to development infrastructure, bonding, coordination of development with surrounding communities, contracting for municipal services, financial management of in-kind consideration for each project and other appropriate tasks as needed and requested by the military.

The Utah MIDA legislation is unique in the nation and is leading the way in partnering with the military in enhancing and upgrading military properties within the state. In return Utah increases military value of the installations located within the state, increases the number of military and military jobs in the state and adds federal lands to the tax rolls.

Falcon Hill at Hill Air Force Base

For many years, HAFB has been an economic engine for northern Utah. It provides thousands of direct jobs and thou-

sands more of ancillary employment. Though tax-exempt itself, HAFB is the catalyst for generating millions of dollars of tax revenue annually to the State of Utah and local governments. In view of HAFB's fiscal impact, state and local governments provide assistance, in appropriate ways, to ensure HAFB's long-term viability and economic vitality.

Falcon Hill National Aerospace Research Park is the first project to be undertaken under MIDA/EUL legislation. The area to be developed consists of 550 acres of Hill Air Force Base lying along the west edge of the base and adjacent to Interstate-15. The land spans portions of both Davis and Weber counties and includes portions of the cities of Clearfield, Sunset, Roy, and Riverdale, as well as unincorporated Davis County. The vision of the developers and the Air Force includes creating a business and research park that is developed with the declared intention of creating a pleasant and attractive physical environment that will attract aerospace and defense industry occupants. Such tenants will further support HAFB's mission, thus sustaining its long-term viability. This synergistic relationship will be a benefit to the state's economic development interests.

The development of a research park close to HAFB is consistent with the state's economic development objectives. Aerospace is one of the seven economic clusters targeted by the Governor's Office of Economic Development. The University of Utah Research Park has only 26 acres remaining for development which are being held by the University for departmental uses. Therefore, an additional research park along the Wasatch Front will assist in meeting these development objectives. Many employers in the aerospace industry are located in Salt Lake, Davis, and Weber counties. Hill Air Force Base is centrally located to this concentration, making Falcon Hill, with its aerospace focus and related businesses, an ideal fit.

Based on information provided by the developer in November 2008, Falcon Hill will include an investment of \$600 million in buildings and land, plus an additional \$23 million in personal property value over the next 15 years. Assuming 550 acres are developed, this represents an average investment of \$1.1 million per acre for the project, significantly more than the average in the respective counties. This level of investment is estimated to generate over \$102 million in property taxes over the next 20 years.

While the majority of the investment will be in office space, plans are also provided for retail, restaurant, and hotel facilities that will support the influx of workers, contractors, and visitors. The staffing for the office, retail, restaurant, and hotel properties is expected to provide more than 19,000 jobs. Wages paid will be spent in the local economy, thus creating a multiplier effect that will benefit other areas and businesses. Wages in the aerospace industry, which will have a significant presence in the proposed development, range

between \$71,000 and \$73,000, almost double the current state average of \$38,000.

The Air Force and developers are projecting construction of a reconfigured West Gate entry road will commence December 2009. A new “West Gate” east of the existing gate will be included in the construction. When completed, the security fence will be moved east to accommodate public access to the eventual commercial development.

Construction of the first commercial building will begin shortly after construction of the new road begins. The 150,000 square foot building is being built to house the ICBM program and will be ready for occupancy in early 2011. Although this is a taxable commercial building it will remain behind the security fence.

The Air Force and developers are in discussions with several new tenants and several announcements of new buildings and new jobs are anticipated during 2010.

MIDA Projects and Potential Projects

MIDA is currently working on two Air Force projects and has opened discussions for possible participation in a co-generation project at Hill Air Force Base (HAFB). MIDA has been in discussions with the Army on potential projects in Tooele County and with National Security Agency (NSA) officials for assistance on their announced development at Camp Williams.

Air Force Resort Hotel—Park City Vicinity. In 2002 Congress provided the Air Force with property near Park City for an Air Force resort hotel. It was anticipated the property would be traded for a more strategic site. MIDA has

been working with the Air Force and community leaders to find a site and developer for the planned recreational facility. It is anticipated a site will be selected in 2010 with planning efforts to follow shortly thereafter.

HAFB-Energy Co-Generation. Air Force Real Property Agency is preparing an RFQ and has scheduled an “Industry Day” for December 9, 2009, to solicit proposals to retrofit an existing 260 steam plant building to a co-generation steam and electric plant at an investment cost of up to \$50 million. MIDA has been asked to be available for possible participation in the project.

Army—Tooele Army Depot. During November 2009, MIDA was approached by the Army Corps of Engineers about participation in an EUL at Tooele Army Depot. The project has not yet been defined but will most likely follow a similar approach to Falcon Hill’s. The Army is also looking at one or more energy projects in Tooele County. Planning for all of these projects is expected in 2010.

Camp Williams—National Security Agency (NSA). MIDA was approached by NSA to aid in the development of their announced Utah Data Center at Camp Williams. NSA would like to sole source construction of off-site improvements, i.e., sewer, water, etc., to MIDA. MIDA would, in turn, work with the Utah Division of Facilities and Construction Management to complete the projects and supervise construction.

MIDA is also exploring opportunities for additional on- or off-site private development of one or more office buildings to house contractors who will follow the NSA Data Center once it is operating.

Revenue Forecasting and the Utah State Budget

Overview

A revenue forecast is a prediction of the amount of money available for future spending. In the United States, state governments must balance planned expenditures with revenue collections. States largely finance their operations by taxing economic activity. A revenue forecast models the relationship between the economy and the tax system. These models rely on mathematical techniques, historical trends, and analytical judgment to form a reasoned expectation of future revenue collections upon which budgets are balanced. Involving the future, a revenue forecast is a risky exercise. Multiple sources cause uncertainty, from the future state of the economy to the accuracy of the models estimating revenue. Governments have developed budget mechanisms to mitigate the impact from the persistent uncertainty of revenue collections. Also, most states' revenue forecasts involve a negotiation between the expectations of the executive and legislative branches; often leading to a consensus outlook to which budgets are set.

Public Policy

Public policy is the process that extracts and allocates common resources for collective action. These decisions are codified in constitutions and laws, but stretch further, to encompass the cultures, institutions, conventions, priorities, and concerns of a society. The United States is a federation, allowing some flexibility in tailoring public policy to the unique circumstances confronting each state. The budget is the authoritative statement detailing the allocation of state resources among competing public interests. The budget summarizes the public goods and services (e.g., courts, policing and corrections, transportation infrastructure, education systems, social services) that interact with and support the larger market economy. Plans that are proposed, but not included in the budget stake out the limit of government action. The process used to make a budget is important because such design heavily influences the ultimate budget. Forecasting the revenue available for future spending is the critical first step in the budget process.

Economic Forecast

Economic activity provides the skeleton upon which a revenue forecast rests. Government revenue is generated as taxes are levied against economic activity.

A revenue forecast begins with an evaluation of the national and local economies. The economy represents all the production, consumption, and trade people undertake. These data are compared for relationships among: production, consumption, investment, exports, imports, prices, wages, employment, population growth, profits, inflation, interest rates, wages, sales, sentiment, savings, productivity, etc. Judgment, historical data, and math combine to produce a model of the future economy. States may focus on important parts of their local economy (e.g., Alaska on the production and price of

oil, Nevada on travel and tourism, New York the health of Wall Street, Michigan the manufacture of automobiles). Many states focus on the United States economy, having diverse local economies that normally track national trends.

The economic forecast represents a structured and consistent way of anchoring a revenue forecast to the future. As the future economy is realized, revenue updates consistent with economic changes can be made (e.g., if the economy unexpectedly enters a deep recession, future expected revenues will drop sharply consistent with the change in economic conditions). Changes to the economy can dramatically impact budgets, altering both the demand for public goods and services and the ability of governments to fund such efforts. The economic forecast is often the main source of error in forecasting revenue, but it also provides the principal explanation for why revenues change.

In Utah, a group of private and public economists, the Revenue Assumptions Committee, meets regularly to build consensus regarding the direction of the economy. Utah is a relatively small, but quickly growing state with a well-diversified economy. The state has a rapidly growing population, with the highest fertility in the country (Total Fertility Rate of 2.47). Utah has the third highest life expectancy at 78.7 years, has one of the youngest populations with a median age of 28.7 years, and has the largest average household size at 3.15 persons. The state has low poverty rates (seventh among states), high educational attainment (seventh among states in high school graduation rates), high median household income (ranks 10th), and is highly urbanized. Utah's employment distribution among industries closely matches that of the United States (Hachman Index of 0.98).

The Revenue System

A revenue system encompasses all the taxes, fees, and transfers received by a government to fund expenditures. The revenue system is complex, and is constantly adapting to changing circumstances, policies, and priorities. These can include: changes in the behavior of consumers, businesses, or the economy, explicit changes in state tax law, new federal tax law impacting state collections, accounting or system changes impacting the timing and realization of revenue, or modified federal funding formulas. The revenue generated from an economy can change significantly under a modified revenue system, while taxes can also change economic prospects. Accounting for these changes is critical to providing accurate revenue forecasts.

The 2007 Summary of State Government Finances reports that state governments collected \$1,020.4 billion in taxes and fees, also collecting \$430.2 billion in transfers from the federal government. Together, revenue for state government purposes totaled \$1.5 trillion, 11% of the value of all goods and services in the United States in fiscal year 2007.

Analysis of these figures reveals a highly variable mix of taxes, fees, and transfers used by states. On average, state revenue is comprised of: 16.0% individual income tax, 15.1% general sales taxes, 3.4% corporate income taxes, 35.5% other taxes and fees, and 30% federal transfers. At the extremes: Oregon receives 33% of total revenue from an individual income tax; Washington receives 35% from general sales tax; New Hampshire generates 11% of funding from corporate income tax; Alaska receives 70% of total revenue from other taxes (mostly severance taxes on oil); Mississippi receives the greatest share of federal transfers at 52%, while Virginia has the lowest share at 20%.

Utah's revenue system is similar to that of an average state. Utah receives a greater share of funding from the individual income tax, at 21%, than the average of 15%. General sales tax, corporate income tax, and other fees are near average at 16%, 3%, and 36% respectively. Other taxes and fees range from severance taxes on resource extraction to charges like tuition, public hospital fees, license fees, or tobacco taxes. Federal transfers are lower in Utah at 20% compared to 25% on average for other states. These include funds for constructing airports, highways, sewerage, mass transit, public housing; as well as funding for education, health, and other public welfare programs.

According to the National Conference of State Legislatures, differences in revenue systems among the states "reflect the vast differences in state economies, resource endowments, demographics, history, and citizens' differing expectations of what government ought to do and how taxes should be levied." A functional understanding of current and future state and national tax law combined with an awareness of how revenue systems flex under varying economic conditions in the context of a particular state's political climate is critical in developing a revenue forecast.

Revenue Forecast

A revenue forecast is a reasoned prediction of the amount of money a state will collect in the near future. It serves as objective information to improve the decision making of the major participants building the budget. Though a technical exercise, revenue forecasts are created in a political context. As part of the political process, revenue forecasts respond to conflicting political forces, from efforts to expand or cut government programs or to reduce or raise levels of taxation.

Similar to evaluating the economy, forecasting revenue begins by collecting historical data on revenue collections. These data can often be extracted from budget documents, financial reports, information systems, or legislative summaries. These reports reveal the history of the tax system. These data, in conjunction with the likely movement of the economy, form the basis of predicting revenue collections in the near term.

There are many potential models from which to forecast revenue, but most rely on applying some mathematical tech-

nique to a set of data to generate new information. For example, a technique may rely on the usual interdependent movement of employment, wages, and the individual income tax. Based upon the expected change in employment and wages a mathematical formula calculates a forecast of the income tax. These econometric models may be simple or complex. Time-series models may focus on the current trend in collections. Simulation models utilize the underlying data-generating process to arrive at a forecast. Judgment influences the use and combination of these techniques. For example, a forecaster may realize a planned administrative change part way through a fiscal year will impact collections beyond the movement in the economy, or realize that a dramatic change in recent trend is illusory and subject to quick correction based on a change in accounting.

Utah, like most states, performs a revenue forecast across different branches of government. This is a check and balance on the forecast process. Statutorily, the Governor maintains discretion over his budget recommendations, while the Legislature appropriates the budget to officially adopted revenue. Independent revenue forecasts, by source, are provided and then jointly analyzed by the Tax Commission, the Governor's Office of Planning and Budget, and the Legislative Fiscal Analyst and a consensus revenue estimate. As with many states, this discipline stems from external evaluations of a state's credit worthiness. Forecasts manipulated for political reasons can damage these evaluations; a consensus position can mitigate these concerns.

The practical concern in forecasting revenue is in finding methods that will produce accurate information. Academic research tends to confirm that the 'best' forecasting method is a weighted average of forecasts generated by different techniques. A review of the prevailing literature also indicates that most states intentionally under forecast revenue as a buffer or hedge against an uncertain future. Utah is not an exception to these practices, as will be discussed in a later section.

Risk and the Budget

If revenue forecasts are too high, states will have insufficient funds to cover planned expenditures. If revenue forecasts are constantly too low, the excess money can create pressure to reduce taxation or skew funding priorities.

State governments' spending represents 11% of all economic activity in the United States. This spending is reflected in vast networks of roads and highways, nearly a hundred thousand elementary or secondary schools, thousands of institutions for higher learning, facilities to house and monitor more than one million prisoners, an army of police or other protective officers, training, equipment, and supplies for nearly half a million soldiers, an array of hospitals, doctors, medical care, and other public welfare programs for the indigent, thousands of parks and other recreation sites covering millions of acres, tax collectors, accountants, scientists, and other administra-

tion to operate, organize, monitor, and control trillions in money, material, and personnel.

State governments are not immune to the rapidly and ever-changing world. States, like people and business, form strategies for dealing with an uncertain future. These include opportunities that can be exploited for the good of the public, but also include mitigation strategies for averting or managing disasters. The major tool utilized by most states to protect against the risk of falling revenue is a ‘rainy day fund’; these funds are structured to capture surplus revenue generated in good times as savings to be used when revenues are weak or falter. Other mechanisms include: funding capital projects with cash rather than bonds (‘working rainy day funds’), shifting the timing of expenditures or tax receipts, cutting spending, raising taxes, receiving transfers from the federal government, and hedging revenue estimates. Some view prudent budgeting as a lasting risk mitigation strategy – saving rather than spending the gains from economic exuberance.

There are three important features of rainy day funds: 1) allocate money for saving; 2) fund size; and, 3) rules for drawing down funds. Some states maintain automatic or even constitutional triggers that require appropriating funds to these types of accounts, as there is rarely a political constituency for saving money. Many states automatically reserve a portion or all of a revenue surplus, or require funds be replaced by a certain time. The size of the fund is important: too large and taxpayers may revolt, too small and reserves may prove inadequate. To withdraw funds, many states require a revenue shortfall at the end of the year, depressed economic indicators, or a legislative super-majority. Regardless of rainy day fund size, saving by state governments can mitigate some of the pressure to increase taxes or cut services during times of economic stress.

Utah maintains rainy day funds, an appropriations limit, and conservative budget practices to mitigate uncertain revenue collections. The rainy day fund is largely replaced by automatically transferring 25% of excess revenue collections, up to 6% of appropriations, though the legislature can appropriate additional funds above such cap. Spending is restricted to covering a budget deficit, paying refunds, or paying court settlements. Utah has, until recently, maintained large ‘working rainy day’ funds by paying cash instead of bonding for capital projects.

Utah Forecast Accuracy

In an effort to evaluate the relative forecast accuracy in Utah, a database of major revenue sources and fund totals was prepared containing the revenue forecasts and actual revenue collections realized since 1970. The data set contains 2,217 pieces of information over 39 years of realized history. The information contains the forecasts from the Governor’s Budget Recommendations, and forecasts adopted during General Legislative Sessions. Merged with these data are annual inflation growth rates based upon changes in the U.S. Consumer Price Index.

Analysis of these data show that inflation-adjusted growth in the General and School Fund averages 3.9% each year. The range covers a low of a 13.8% contraction to extraordinary growth of 20.0%. Normal real growth (the interquartile range) spans from 0.0% to 8.0%. Half of the time, revenue growth is above 3.8%. Average real growth is: 3.1% for the sales tax, 5.7% for the individual income tax, and 7.6% for the corporate income tax. In addition to the sales tax, the General Fund is composed of investment income, insurance premiums, severance taxes, beer, cigarette, and tobacco taxes, liquor profits, cable/satellite taxes, and other fees. General Fund growth averages 2.9%. The Utah Constitution earmarks all income tax receipts for funding education. Over this period, the School Fund has averaged 5.1% growth. The Transportation Fund averages 1.4%, being comprised of excise taxes and registration fees; these are less sensitive to economic growth.

There are multiple ways of analyzing accuracy, including mean absolute percent error, mean absolute deviation, root mean square error, quadratic scoring, and percentage of turning points, among others. To emphasize simplicity, the accuracy measure used here is the difference between forecast and actual growth. Focusing on the shortest forecast window (i.e., the February Legislative Session forecast for the current fiscal year ending in 135 days), on average, the forecast has underestimated growth by 2.7%. Over this period, average non-inflation-adjusted growth was 8.5% while the average growth forecast was 5.8%. Volatile sources of revenue were under forecast by larger amounts. The difference in actual and forecast growth was -1.5% for sales tax, -2.5% for the general fund, -1.2% for individual income tax, -10.3% for corporate tax, -2.7% for the school fund, and -0.5% for the transportation fund.

Revenue forecasters are not fortune tellers. Rather, they provide educated guesses of the likely change in revenue based upon economic relationships and enacted tax changes. Accurate forecasts would require that budgets be adjusted mid-year half of the time; four of the last 39 years resulted in over forecasts. Utah, like many other states, uses a biased revenue forecast as a hedge against potential revenue shortfalls. This bias is somewhat consistent across forecast periods. Some forecast periods, however, appear to maintain a larger hedge than others. Both the Governor and the Legislative current fiscal year forecasts under predict revenue growth by about 2.5% and are statistically significant. The Legislative out-year forecast (495 days) maintains a statistically significant hedge of 1.7%. Only the Governor’s out-year forecast (585 days) appears to be an unbiased estimate with a statistically insignificant hedge of 0.7% of revenue growth.

Summary

Revenue forecasts are the initial input to state government budgets. They provide guidance to state agencies to frame budget requests, as well as place a ceiling on expenditures

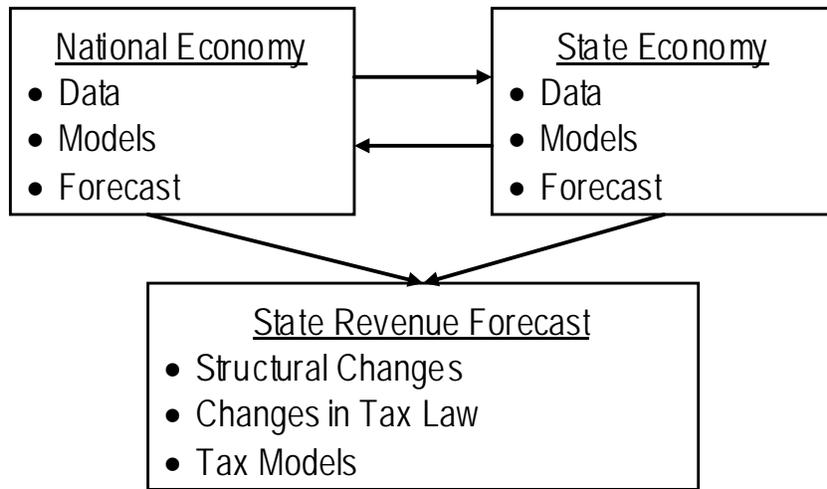

under balanced budget requirements. Forecasts are important tools in managing the process of allocating collective resources. They are also the primary means through which tax, fee, and other resource collection mechanisms interface with policymakers – changing taxes in either direction has consequences for state spending.

State budgeting relies on revenue forecasts as critical information regarding the level of collective funds available to service demanded public goods and services. Dependent upon such demand, the information signals to policymakers whether they can fund projects or programs or change taxes. The revenue forecast sets the stage for budget discussions and negotiations. As part of the budget process, a revenue forecast is structured around budgetary needs and process. States prefer a downwardly biased revenue forecast as an initial

hedge against the uncertainty of future revenue collections. Other mechanisms also dampen revenue volatility, rainy day funds and appropriations limits. However, the cost of eliminating uncertainty is high (such would require a state to save a lot of money), while reviewing spending or taxation in difficult times can force efficiency in state government spending.

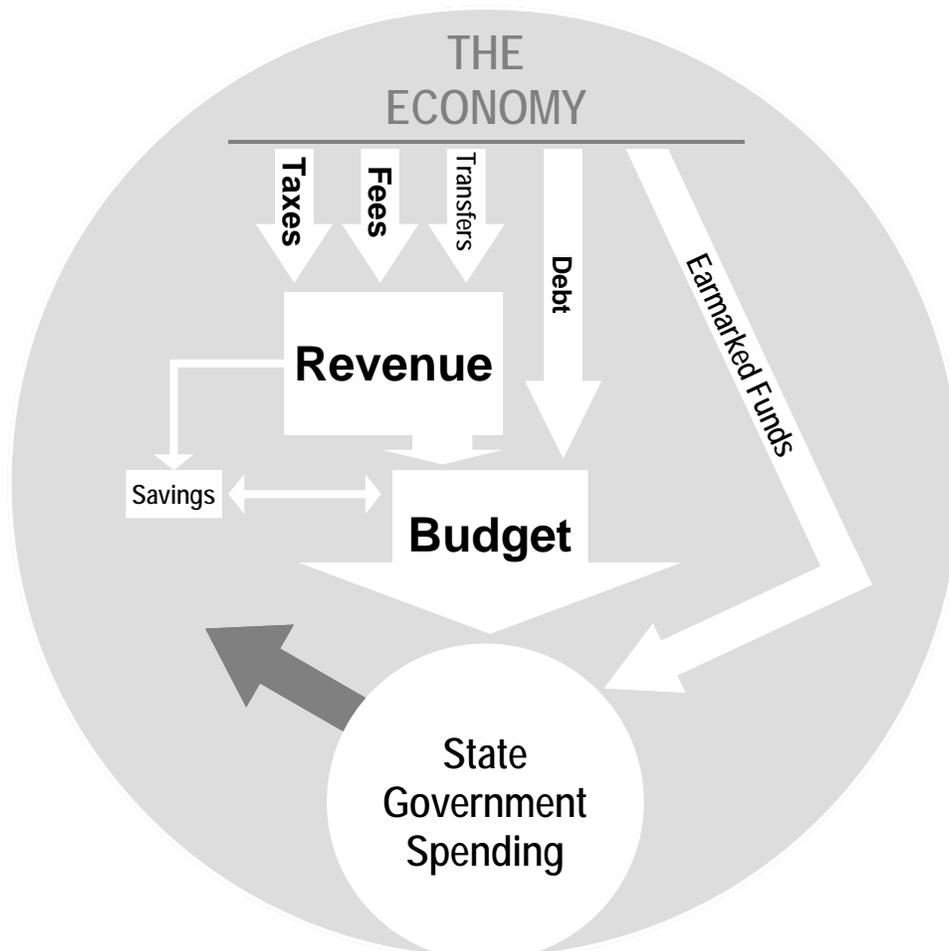

Utah mirrors the revenue forecast processes of other states. Analysis confirms that Utah, on average, under forecasts revenue growth by about 2.5%. In the last 39 years, General and School Fund revenue was over forecast six times (1974, 1983, 1986, 1996, 2001, 2008). Such deficit requires revisiting budget decisions. Hedging in the revenue forecast usually provides for a surplus; a portion of which is committed to building Utah's rainy day funds.

Overview

Utah's housing industry reached the bottom of the sharpest decline in history. A decreased supply of complete unoccupied homes and declines in mortgage rates were offset by rising foreclosures, industry consolidation, and further declines in permits. Utah homebuyers looked at 2009 as the opportunity to take advantage of record low interest rates, state and federal government stimulus, and declining prices that together created a tremendous improvement in affordability.

Utah Inventory Returns to Healthy Levels

Supply in 'A' location areas and in affordable price segments is limited. Newreach, Inc. reported that the inventory of complete unoccupied new homes along the Wasatch front declined to 1,515 in the third quarter 2009. After peaking in third quarter 2007 at 3,217 new residential construction slowed as evidenced by the sharp decline in permits. The reduction in inventory was further accelerated by Utah's Home Run program in the third quarter 2009. Inventory levels of complete unoccupied homes, at 7.17 months of supply, have returned to the high end of a healthy range. A range of five to seven months is considered historically balanced. Remaining inventory is generally in fringe areas and in higher price markets. Inventory levels are expected to continue to decline in 2010.

Permits Set Record Declines

Single-family permits fell to 4,600 in 2009, 78% below the 2005 peak of 20,912. This represents both the sharpest decline in permits and the lowest annual level of single-family permits in 40 years. Looking forward, builders anticipate a 7% to 10% improvement in 2010. This incremental improvement is a positive sign; however, permits are likely to remain suppressed due to the increasing supply of foreclosures re-entering the market.

Foreclosures Continue Through 2010

Foreclosures in Utah, at 3.0% of all loans, set a new record in the third quarter of 2009 and represent 13,223 loans, a 113% increase over the third quarter of 2008. Utah has been slower than many states to feel the effects of foreclosures, but they are expected to continue to rise throughout 2010 and into 2011. Utah continued to be in a healthy position relative to other Western States such as Nevada which has a foreclosure rate of 9.4%. Arizona, California, and Idaho have foreclosure rates of 6.2%, 5.8%, and 3.5% respectively. As foreclosures rise in Utah they will continue to put downward pressure on pricing.

Continued Industry Consolidation

Tight lending standards and a downward shift in demand led to continued industry consolidation in 2009. Through October, the number of builders applying for permits declined to 540 builders from 697 in 2008 and 1,496 in 2007. This represents a 23% decline from 2008. Even more telling is the de-

clining number of builders applying for 10 or more permits—only 41 in 2009 compared to 136 in 2008, a decrease of 70%. These builders often operate as homebuilding companies as opposed to individuals who speculatively build only a few homes each year. Historically, builders would quickly return to the market when the economy improved. However, as long as banks remain reluctant to make construction loans, it will be challenging for builders to return to the market.

Homebuyers Effectively Time the Bottom

For Utah homebuyers, 2009 was one of the most affordable opportunities to purchase a home in recent history. Home prices declined 7% compared to 2008, interest rates hovered near 5%, and throughout the year, \$14,000 in government incentives was available for first-time homebuyers and those purchasing new homes. The combination of these factors created a unique purchasing opportunity. In 2010, home prices are projected to see further incremental declines but this will be offset by the discontinuation of government stimulus and the expectation that interest rates will rise incrementally. Homebuyers purchasing in 2009 effectively timed the bottom of the market.

Interest Rates Drive Affordability

The Federal Reserve worked diligently throughout the year to keep mortgage rates in check. Rates averaged 5.05% throughout 2009. For brief periods, mortgage rates fell as low as 4.78% for some homebuyers. Throughout 2008, mortgage rates averaged 6.03%. This 98 basis point improvement in mortgage rates gave homebuyers 10% more purchasing power than they had in 2008. Low interest rates have been the main drive for consumer demand and recovery in the housing industry. Rates are expected to rise incrementally in 2010. Rising rates will negate any improvement in affordability gained by further decreases in home prices.

Utah Homebuyers Hit a "Home Run"

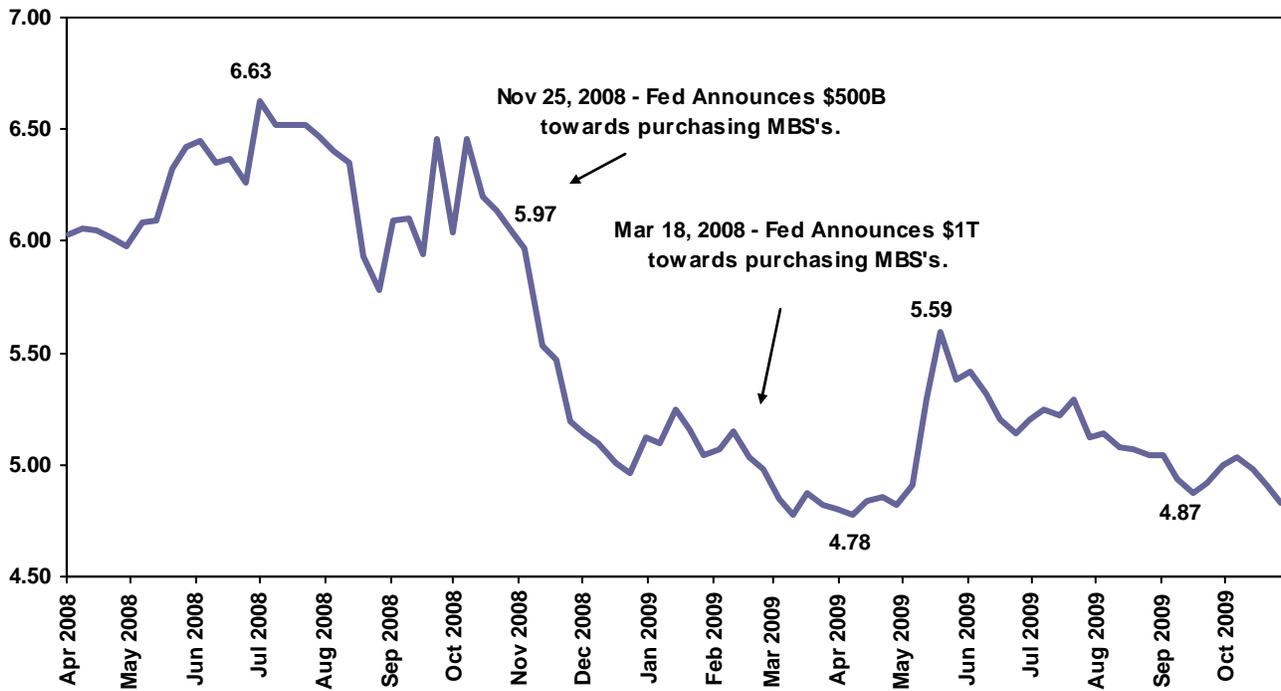

Utah's Home Run program was one of the most aggressive and effective housing stimulus programs in the country. Seventeen states proposed or implemented housing stimulus programs in 2009. Of these, Utah's Home Run program was the most timely, targeted, and effective.

This \$18 million investment of federal stimulus funds, administered by the Utah Housing Corporation, helped 3,645 Utah homebuyers purchase \$831 million of real estate. Of those taking advantage of the program, 86% purchased homes below \$300,000. Additionally, 62% had a household income of less than \$60,000. The program impacted 25 of Utah's 29 counties and helped further reduce Utah's new home inventory to 49% below peak levels.

2010 Outlook

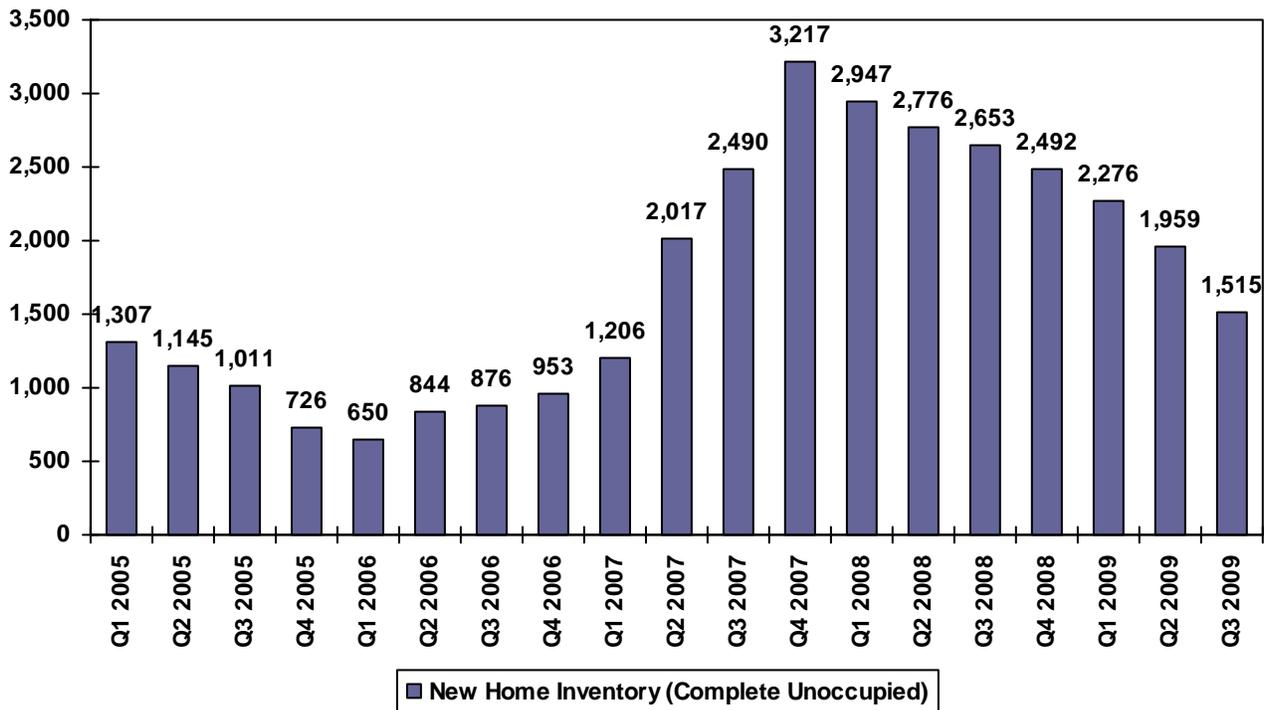

Continued declines in housing prices combined with discontinued government stimulus programs and incrementally increasing interest rates will result in higher home prices. Inventory levels should continue to decline in 2010.
